About This Book

This manual explains how to make beautiful sheet music and MIDI files using a computer, some free software, and the ABC 2 music notation.

It's aimed at musicians with some computer expertise who don't want to spend a lot of money on commercial music software. Both folk and classical musicians may benefit from this guide, not to mention music teachers!

This manual comes in printed and electronic versions; the latter is accompanied by a few audio files. Just like the software that is used to make the music, this manual is free and can be freely copied and shared.

I hope you will find my work useful and enjoyable.

Cheers,

Guido Gonzato =8-)

Chapter 1

Music on the Computer with ABC 2

1.1 Introduction

To you are a musician and if you can use a computer, you are lucky. First of all, because you are a musician; secondly, because the computer is a precious tool for writing music. Lots of programs are available, even for free.

Most music notation programs have a visual approach: one or more staves are displayed on the screen, and the user drags and drops notes and symbols using the mouse. An alternative approach is writing music using a *text-based notation*. This is a non-visual mode that represents notes and other symbols using characters. A specialised program then translates the notation into printable sheet music in some electronic format (e.g. in PDF) and/or into a MIDI file.

Visual programs are easier for beginners and are probably more intuitive, but text-based notations make for faster transcription and have other advantages.

Many text-based notations have been invented. ABC, introduced by Chris Walshaw in 1991, is one of the best: being simple, easy to learn yet very powerful, it has gained widespread popularity. Thousands of tunes written in ABC are available on the Internet: in fact, this notation is the *de facto* standard among folk musicians. The ABC home page is http://abcnotation.com.

ABC was later expanded to provide multiple voices (polyphony), page layout details, and MIDI commands. This is a major release of the ABC notation, and has been called ABC 2: its formal description is available at http://abcnotation.com/wiki/abc:standard:v2.2.

A few programs implement most ABC 2 features and provide some extensions, which in turn may become part of the ABC standard in the future. The purpose of this guide is to introduce the reader to ABC 2 and the most important features of its related programs. Ideally, people who could benefit from this manual are:

- folk musicians who would like to learn as little ABC as necessary to understand the files they find on the net. These people can skip the part about harmony, and probably do not need to study this guide thoroughly;
- classical musicians who would like to use ABC 2 for typesetting their scores.

In both cases, if you wish to print sheet music for your choir or band, or make a song book, or perhaps just teach music, you have found the right tool. And it's also free!

The ABC 2 home page is http://abcplus.sourceforge.net.

A Few Words About "Standards". Although ABC 2 is formally defined, what you get using software differs sligthly from the theoretical standard. This guide will concentrate on practical implementations of ABC 2, not on theoretical features.

Deprecated syntax variations of old ABC releases will not be explained, or even mentioned unless necessary. I'll try and show you just *one* way to do things: the right way (hopefully). I will be covering most features and options of the available programs.

For the sake of simplicity, in the following I shall simply write "ABC" instead of "ABC 2".

1.1.1 Requirements

I assume that you have a PC with Windows, Mac OS X, GNU/Linux or other Unix variants, and that you are reasonably familiar with computers. An Android tablet (or even phone) is a viable alternative.

Expertise in the Windows or Unix command line interface is not required. It is required, however, that you can read music: the treble clef and two octaves starting at middle C should suffice.

1.1.2 Software

The state of the art of ABC is currently represented by two great little programs: the abcm2ps typesetter, and the MIDI creator abc2midi. Both are free software released under the GNU GPL license.

abcm2ps reads ABC files and converts them to SVG (Scalable Vector Graphics) or PostScript. The latter is a file format closely related to PDF, and it can be viewed and printed with another free program: Ghostscript. This application converts PostScript files into several formats, PDF being the most important. SVG output is currently slightly less complete than PostScript; however, SVG output is great for Web pages, and is fully editable with graphics programs such as Inkscape.

The author of abcm2ps, an organist and programmer called Jean-François Moine, releases "stable" and "development" versions of his program. The latter has many enhancements, but it may be also contain bugs and/or alter the score looks in some way. As of this writing, ¹ the stable release is 7.8.14, and the development release is 8.8.3. In the following sections, features provided by the development release will be marked by the symbol.

abc2midi converts ABC files to MIDI. It is part of the abcMIDI package, which include other utility applications. Its usage will be described in Part 5 (page 75) of this guide.

₩ Warning

Please note that abcm2ps and abcMIDI are not completely compatible with each other. The former supports several ABC features that only make sense in printed music, plus others that the latter does not support (yet); for example, nested tuplets. Therefore, don't be surprised if you can't hear some music features that you can see.

Since ABC files are plain text files, an essential tool for writing them is a good text editor.

¹September 3, 2015.

Countless free editors exist, some of which have facilities for editing ABC files. In general, any application that can be used to write text can also be used to write ABC files.

abcm2ps and abc2midi are *command-line driven* programs: in short, you cannot start them double-clicking on their icons. To use these programs, you have to open a command shell (Windows Command Prompt, Unix or Android terminal) and type commands. Geeky stuff!

Scared off? Don't worry: the command line can be avoided. There are programs that gather all relevant pieces of software in a single integrated environment; they are listed at the ABC 2 home page. Let me cite these two options:

- EasyABC (Figure 1.1), a multiplatform program available for Windows, GNU/Linux, OS X;
- The MandolinTab (once Folkinfo) Abc Converter (Figure 1.2): a web interface to abcm-2ps and abcMIDI.

The MandolinTab converter is probably the easiest solution, as you don't have to install anything.

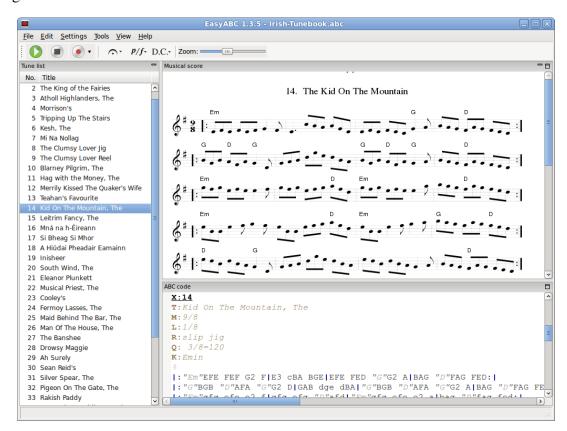

Figure 1.1: Managing a tune collection with EasyABC.

1.1.3 Why ABC?

I know from experience that graphical programs (nearly all are commercial software) are considered easier to use than non-graphical ones.² So, why should one learn ABC?

²erroneously, but only expert users realize it.

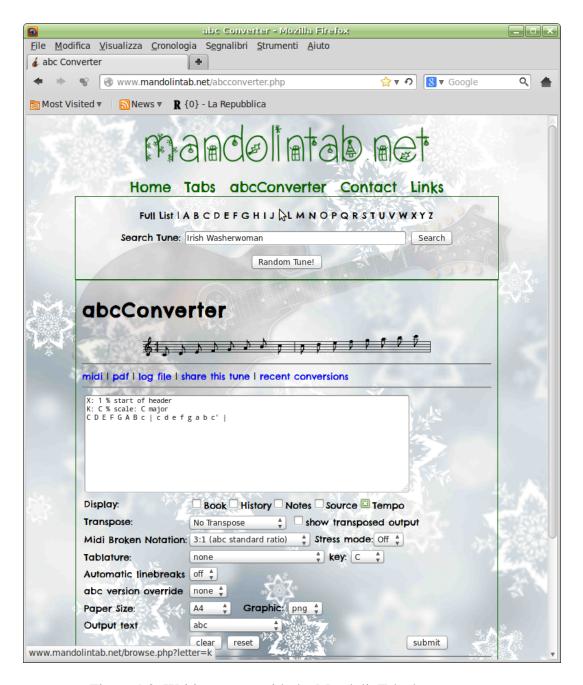

Figure 1.2: Writing a tune with the MandolinTab abc converter.

1.1. INTRODUCTION 5

Well, compared to graphical programs ABC has many advantages:

smart: ABC allows for small and readable files, easy searching and indexing of tunebooks, easy creation of music archives, etc;

text only: the importance of this feature can't be overemphasised. Being simple text, ABC music can be read and written by any computer system on Earth; can be used by visually impaired people, texted by phone, scribbled down on beermats, . . .

scalability: with ABC you can create scores from very simple to highly sophisticated;

ease of use: ABC is easy to learn, and after a little practice it becomes very intuitive;

quality: using abcm2ps, ABC produces publication quality sheet music;

price: while commercial software is often expensive, nearly all programs for making ABC music are free, and can be freely copied and shared with your friends or students;

low resources: ABC programs are very compact and can run on old computers, or even tablets or smartphones;

portability: music is created as PostScript or PDF and MIDI files instead of proprietary file formats. This way, you can share your music with everybody, not only people who have the software to produce it;

flexibility: inserting music written in ABC in web pages or word processor files is very simple;

speed: writing music in ABC is *much* faster than using any graphical program;

learning value: if you teach music, ABC in an invaluable tool that facilitates the learning of music theory;

fun: in my humble opinion, writing music in ABC is more fun!

Needless to say, there are disadvantages as well:

learning curve: while a graphical program may allow you to get started right away (at least in theory), ABC requires that you take your time and study the syntax before you can get started;

file conversion: if your work environment forces you to use a specific commercial program, you may find it difficult or impossible to convert existing music files to ABC and vice versa:

limitations: ABC can't do everything. Currently, it can't deal with some types of music, such as Gregorian chant and non-European music.

To overcome the first hurdle, this guide is hopefully a good start; but I also recommend that you look at some scores to see real-life examples of ABC in action. The ABC home page has many links to ABC collections; on the ABC 2 page you will find more complex choral scores.

1.2 Getting Started

In order to write music with ABC, you follow these steps:

- 1. using an editor, write the tune using the ABC syntax;
- 2. convert the tune using abcm2ps, creating a PostScript or SVG file;
- 3. view the PostScript file with Ghostscript or other viewer, or the SVG file with any browser:
- 4. convert the PostScript or the SVG file into PDF format;
- 5. optionally, create a MIDI file with abc2midi;
- 6. finally, if the music you wrote is free from copyright, publish it on the web for others to enjoy!

1.2.1 Installing the Programs

Relevant web pages:

- the abcm2ps typesetter: http://moinejf.free.fr http://abcplus.sourceforge.net/#abcm2ps
- abc2midi: http://ifdo.pugmarks.com/~seymour/runabc/top.html http://abcplus.sourceforge.net/#abcMIDI
- Ghostscript (all platforms except Android): http://www.ghostscript.com/
- Sumatra PDF viewer (Windows): http://www.sumatrapdfreader.org/free-pdf-reader.html
- EasyABC: http://easyabc.sourceforge.net
- The MandolinTab (once Folkinfo) converter: http://mandolintab.net/abcconverter.php

Ready-to-run packages for Windows, GNU/Linux, Mac OS X, and Android are available from the ABC 2 web site. Besides, all GNU/Linux distributions include Ghostscript and a document viewer that reads PostScript. SVG output can be viewed with any web browser.

At the moment, Android has no Ghostscript support and only SVG output is usable. It's not as powerful as PostScript, but it's pretty close.

1.2.2 ABC in a Nutshell

ABC music is written in text files with extension .abc or .abp. The extension is not obligatory, but highly recommended.

ABC uses the characters you find on standard computer keyboards to represent notes and symbols:

- characters like A B C a b c z represent notes and rests;
- accidentals, ties, slurs etc. are written with characters like = _ () and so on;
- expression symbols are notated with words like !fff!, !fermata!, !tenuto!, ...
- the metre, clef, title, and other tune properties are written in words called *fields*, like M:, K:, T:;
- low-level details (that is, formatting parameters or MIDI commands) are written using *commands* like %%titlefont or %%MIDI program 19.

In short: all musical features are written with sequences of characters.

A tune, which is written in an ABC *file*, consists of two parts: a *header* and a *body*. The header contains information about the tune such as the title, author, key, etc.; these pieces of information are written in fields. The body of the tune contains the music.

An ABC file may contain several tunes, separated by one or more blank lines. Each tune has its own header and body. Some fields can also appear in the body. The file containing ABC music is also called the *source* of the tunes.

Strictly speaking, commands for low-level details are not part of the notation. In fact, ABC was designed for a high-level description of tunes, with no special instructions for typesetting or sound output. That said, ABC 2 provides commands for specifying such details; these will be examined in Section 4.1.

If you don't have a US keyboard, some important characters may be missing. To obtain these characters under Windows, turn the numeric keypad on, keep the Alt key pressed and type some digits:

- Alt-126 to get the *tilde* $\tilde{}$;
- Alt-009 to get a tab character;
- Alt-096 to get an inverted accent .
- Alt-123 to get an open curly bracket {;
- Alt-125 to get a *closed curly bracket* };
- Alt-091 to get an open square bracket [;
- Alt-092 to get a *closed square bracket*].

1.2.3 Our First Score

When the programs are installed, we are ready to write our first score. As our first example, we shall write the C major scale and study the source carefully.

In the following, I'll describe the very basics of ABC usage: the command-line interface, plus an editor. You will see that it's not that difficult after all. Anyhow, remember that you can use the MandolinTab online converter.

There's a very important detail to stress beforehand. Whenever you write an ABC file, you'll have to choose a file name. Any file name will do, *but*:

Very important!

do not use file names containing spaces!

That is: instead of, say, My music file.abc, you must write My-music-file.abc or My-MusicFile.abc. It's very important, because abcm2ps cannot easily use filenames containing spaces. Besides, file names containing spaces are not web-friendly either.

Ok? Good, let's proceed. Commands you must enter are printed in **boldface**.

Windows. Start the cmd program. (Windows XP: from Start/Run..., insert cmd, then click on "Ok". Windows 7 and later: start the menu then insert cmd in "Search Programs and Files".) A black window will pop up showing a line that reads something like:

```
C:\Users\Guido>
```

The first time, and only the first time you use the command prompt, type this command:

```
C:\Users\Guido>md abcmusic
```

and press the Enter key. This command creates a directory (that is, a folder), called abcmusic, where we will save our ABC files. Now, let's enter (double click) the folder:

```
C:\Users\Guido>cd abcmusic
C:\Users\Guido\abcmusic>_
```

Note that the command prompt changed to confirm that you've moved to that folder. Move to the abcmusic folder before writing tunes.

Let's now run the notepad editor. In our example, we'll use the file name scale1.abc.

```
C:\Users\Guido\abcmusic>notepad scale1.abc
```

Clic on "Yes" to create a new file, then copy this source verbatim:

```
X: 1 % start of header
K: C % scale: C major
C D E F G A B c | c d e f g a b c' |
```

Save it, then switch back to the command prompt.

We are ready to make the PostScript output using abcm2ps:

```
C:\Users\Guido\abcmusic>abcm2ps -c -O= scale1.abc
abcm2ps-7.8.14 (March 25, 2015)
File scale1.abc
Output written on scale1.ps (1 page, 1 title, 18832 bytes)
C:\Users\Guido\abcmusic>_
```

To display the PostScript file, launch GSview and open the scale1.ps file that you'll find in C:\DocumentsandSettings\user\abcmusic. The score will look like this:

To convert the score into PDF, select File/Convert... in GSview, set pdfwrite as output type, and choose a dpi resolution; I suggest 600 dpi.

Now, let us make a mistake on purpose: insert the # character instead of the first bar | . Save and try to convert; you will get this error message:

Fix the error in the source, save it and convert it again.

GNU/Linux, Mac OS. Open a terminal window (Ubuntu: Applications/Accessories; Mac OS X: Applications/Utilities). The first time, and only the first time you use the command prompt, type this command:

\$ mkdir abcmusic

and press the Enter key. This command creates a directory (that is, a folder), called abcmusic, where we will save our ABC files. Now, let's enter (double click) the folder:

```
~$ cd abcmusic
~/abcmusic$ _
```

The command prompt should change to confirm that you've moved to that folder. Move to the abcmusic folder before writing tunes.

Now let's start an editor. In GNU/Linux systems, it's likely to be gedit or kate (if it's not, please find out). In Mac OS X, it's simply called edit. The file name is scale1.abc.

```
~/abcmusic$ gedit scale1.abc &
```

Don't forget the ampersand & at the end of the line. Copy this source *verbatim*:

```
X: 1 % start of header
K: C % scale: C major
C D E F G A B c | c d e f g a b c' |
```

Save it, then switch back to the command prompt. We are ready to make the PostScript output using abcm2ps:

```
~/abcmusic$ abcm2ps -c -O= scale1.abc
abcm2ps-7.8.14 (March 25, 2015)
File scale1.abc
Output written on scale1.ps (1 page, 1 title, 18832 bytes)
~/abcmusic$ _
```

To display the PostScript output, GNU/Linux users have a wide choice of viewers; use xdg-open if you're in doubt. Mac OS X has a Preview utility that will automatically open scale1.ps and convert it into PDF format.

```
~/abcmusic$ xdg-open scale1.ps &
```

The score will look like this:

Finally, to convert the file into PDF type this command:

```
~/abcmusic$ ps2pdf scale1.ps ~/abcmusic$ _
```

The file scale1.pdf will be silently created.

Now, let us make a mistake on purpose: insert the # character instead of the first bar | . Save and try to convert; you will get this error message:

Fix the error in the source, save it and convert it again.

Android (expert users only!) To use ABC software on Android, you will have to install a terminal emulator beforehand. Please refer to the instructions available at the ABC 2 home page.

Android users will follow almost the same procedure as GNU/Linux users. The difference is the lack of Ghostscript for the Android platform: you will have to use SVG output instead.

Once your ABC source is ready, use this command line:

```
~/abcmusic$ abcm2ps -c -O= -X scale1.abc
abcm2ps-7.8.14 (March 25, 2015)
File scale1.abc
Output written on scale1.xhtml (1 page, 1 title, 5782 bytes)
~/abcmusic$
```

please note the -X switch: it tells abcm2ps to produce SVG output in a file called scale1.xhtml. To browse this file, just open it with a web browser.

Let us now examine what we wrote in the source. It starts with two header fields: X:, index, and K:, key; both upper-case. These are the only obligatory fields. X: is always followed by a number, which is used to identify the tunes written in a file. The % character begins a comment; everything that follows % till the end of the line is ignored.

Fields may contain spaces. X:1 and X: 1 are equivalent.

The K: field specifies the tune key; C stands for "C major". In some countries, notes are written as "do (ut) re mi fa sol la si (ti)"; if you live in such a country, you may want to consult Table 1.1 that compares notes written in English and in Italian notation. I call it "Italian notation" since it was introduced by medieval Italian composer Guido d'Arezzo.

Italian note	English note
Do	С
Re	D
Mi	E
Fa	F
Sol	G
La	A
Si	В

Table 1.1: Comparison between note names in different notations.

The X: field must be *the first* in the header, while the K: field must be *the last*. Other fields may be inserted in any order between X: and K:.

The next line in the source starts the body of the tune, containing the notes. Upper-case letters correspond to the central octave, while lower-case letters one octave higher. The character inserts a measure bar, which can be entered at any position. That is, you may write measures of variable length, more than or less than the value specified by the metre.

The last c is followed by an apostrophe, which denotes an octave higher. Note that abcm2ps, by default, automatically set the metre as four quarters, and the note length as eighths.

It wasn't difficult, was it? We are now ready to study all the details that will enable us to typeset beautiful scores.

∠ Note

If you use "do re mi...", the main hurdle is getting used to "C D E..." A trick I used was memorizing the notes as "doC", "reD", "miE", "faF", "solG", "laA", "siB" and the reverse.

Homework time. Try and write some ABC files as an exercise. Type random notes if you wish, but get used to writing, saving, converting, and viewing tunes. I suggest that you do your exercises at the end of each of the following sections.

uuuuuuu

Chapter 2

Melody

2.1 Notes and Symbols

THIS part of the manual deals with basic characteristics of notes: pitch, length, accidentals, dots, ties, slurs, tuplets, chords, grace notes, and expression symbols.

∠ Note

In some of the following examples, formatting parameters were removed from the sources for clarity.

2.1.1 Pitch: A-G = a-g,

The following source (scale2.abc) shows how to obtain notes under and above the staff, i.e. notes that sit on ledger lines; the scale is C major. Instead of just writing K:C as in the previous example, we'll add a small bit of code which will be further explained in Section 2.2.1. K:C treble, besides specifying C major, forces the treble clef. In this example it must be specified because there are several notes much below the staff, and abcm2ps would set the bass clef by default. Convert the source without -c:

```
X: 1
K: C treble
% C major, four octaves:
C, D, E, F, G, A, B, C | C D E F G A B c |
c d e f g a b c' | c' e' g' c'' |
```

The rule is: if a note is followed by one or more commas, it goes down one or more octaves; if it is followed by one or more apostrophes, it goes up one or more octaves.¹

Note another important detail: we wrote two lines of ABC notes, which produced two lines of music. This is one of the basic rules of the ABC notation: *a new line in the source starts a new line in the score*. Exceptions will be examined in Section 2.1.13.

In the above example, note spacing is too wide; a single line would probably look better. We can instruct abcm2ps to ignore line breaks and try and format the measures optimally. This is done with -c in the command line.

We'll now reformat the file using -c:

\$ abcm2ps -O= -c scale2.abc

The bass clef is automatically set when we start a piece of music with low notes (F, and below). The treble clef is then set by abcm2ps for higher notes:

```
X: 1
M: 4/4
L: 1/8
K: C
%
C,, D,, E,, F,, G,, A,, B,, C,|C, D, E, F, G, A, B, C|
C D E F G A B c|c d e f g a b c'|
```

2.1.2 Note Length: L:

Unless otherwise indicated, the *note length* is automatically set in accordance to the tune metre. The rule is: if the value of the metre is greater than or equal to 0.75, the default note length will be one eighth; if it is less than 0.75, one sixteenth. For example, when the metre is 4/4 the value is 1 (4 divided by 4 is 1), so the note length will be one eighth; if the metre is 3/4 = 0.75, again one eighth; if the metre is 2/4 = 0.5, the note length will be one sixteenth. By default, the metre is 4/4 and the note length is one eighth.

¹Experts will notice some resemblance to the Helmholtz pitch notation, shifted two octaves.

The L: field is used to modify the default note length, specifying a value as in L:1/4. (To change the metre, the M: field is used; see Section 2.2.2.)

In addition, L: may contain a "keyword", auto. In this case, note lengths are adjusted to fill a measure. This option does not work with abc2midi, so you may want to avoid it.

To double, triple etc. the length of a note, you write the number 2, 3, etc. immediately after. To divide the value of a note by 2, 4 etc., you write $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$... or, equivalently, $\frac{1}{4}$, $\frac{1}{8}$... Spaces between the note and the digit or the slash are not allowed. Let us see an example:

```
X: 1
L: 1/4
K: C
C16|C8|C4|D2 D2|E0 E E F/ F/|
G3 G// G/4 G/8 G/8 G/16 G/16 G/32 G/32 |
% automatic length
L:auto
c | cc | cccc | cccc cccc |
```

Note that abcm2ps supports notes as short as 1/128 and longer than a whole note! The first note in the example is called a *longa*, and its length is four whole notes. The second note is a *brevis*, two whole notes. The spacing between notes is proportional to their length. (We shall see in Section 4.1 how to make the spacing of notes constant instead of proportional.)

Another weird note is the first E in measure 5. The trailing 0 denotes a stemless quarter note, which is sometimes found in early music. $\[\]$ The same effect may obtained with the !stemless! ornament preceding the note. Ornaments will be explained in Section 2.2.8.

Spaces between notes and measure bars can be freely inserted when the notes are longer than one eighth, and are used to improve the readability of the source. But *spaces between notes whose length is equal or lesser than one eighth are not optional*. If these notes are not separated by spaces, they will be grouped under a beam:

```
X: 1
K: C
M: 4/4
%
C D E F CDEF | C D E F C/D/E/F/G/A/B/c/ |
c/B/A/G/ F/E/D/C/ C4 |
```

2.1.3 Rests and Spacing: z z x y

Rests are indicated by the character z (lowercase zed). The same rules for note length apply to rests too, which can also be longer than a whole and as short as 1/128.

To notate multi-measure rests, you use 2 (uppercase zed) followed by the number of measures you want to skip:

```
X: 1
L: 1/4
K: C
Z12|z16|z8|z4|C2 z2|C z C z|
C z/ z/ C z//z///z///z////
```

The characters x and y denote, respectively, *invisible rests* and additional spacing:

```
X: 1
L: 1/4
K: C
C D E/E/E/F/F/F/|C D E/E/E/yyE/ F/yF/yF/yF/ yyyy|xxxG|
```

y can be followed by a width in *points*; default is 20 points. This unit of measurement is widely used in typography; a "point" (PostScript point) is ≈ 0.353 mm.

Invisible rests are often used for transcribing piano music; examples will be shown in Section 3.1.2.

2.1.4 Accidentals: ^_ =

Sharp \sharp is denoted by a $\hat{}$ before the note, flat \flat by $\underline{}$ (underscore), and natural \sharp by $\underline{}$ Spaces between the accidental and the note are not allowed. This is the chromatic scale:

```
X: 1
L: 1/4
K: C
C ^C D ^D | E F ^F G | ^G A ^A B | c^c=cz |
c B _B A | _A G _G F | E _E D _D | C_C=Cz |
```

Double accidentals are indicated doubling the special character: double sharp $\sharp\sharp$ by $\hat{}$ and double flat $\flat\flat$ by $\underline{}$.

Quarter tone accidentals (microtones) are also available. That is, 1/4 and 3/4 sharps and flats can be obtained adding / after ^ or _, while 3/4 are obtained adding 3/2:

```
X: 1
M: 4/4
L: 1/8
K: C
G ^/G ^G ^3/2G A4|A _/A _A _3/2A G4|G3 ^G A4|A3 _A G4|]
```

∠ Note

Unlike normal accidentals, microtonal accidentals don't propagate across a whole measure. This is an important thing to remember when you make a MIDI file, to avoid unexpected results.

2.1.5 Dotted Notes: < >

Notes followed by a dot are printed in two ways. First, by specifying the right length:

```
X: 1
L: 1/4
K: C
C3D|E3/2 F//G// A B| c3/2 B//A// G>F|E D C z|
```

When a note is dotted and the following is halved or vice versa, we are talking of *broken rhythm*. It is obtained using the characters > or < between two notes.

When you use >, the first note is dotted (that is, its duration increases by half) and the following note is halved. The opposite with <. To indicate a note followed by two or three dots, use >> or >>>.

```
X: 1
L: 1/4
K: C
CEGc|C > E G >> c|C < E G < c|C/>E/ C/ > E/ C/<E/ C/ < E/|</pre>
```

∠ Note

Dotted notes are rendered by abc2midi in a peculiar way; please see Section 5.1.11.

2.1.6 Ties, Slurs, Staccato: - () .

A tie is obtained with the character — (hyphen) between two notes *of equal pitch*. Slurs are notated enclosing the notes in parentheses. Finally, the staccato mark is obtained by putting a dot before the note. Spaces between these symbols and the notes are not allowed.

```
X: 1
L: 1/4
K: C
.C/ .C/ D - D .E/ .E/|EF-FG|(C/E/G/c/) (c/G/E/C/)|-C2 z2|]
```

⚠ Note

Although ties and slurs are graphically very similar, they have a completely different musical meaning. Avoid the error of using ties to connect notes of different pitch: MIDI output (see Section 5.1) would be wrong.

Dashed slurs and ties are indicated by a dot before the open parentheses or hyphen sign. Further, the slur and tie direction may be specified adding a ' (above) or ', (below):

```
X: 1
L: 1/4
K: C
.C/ .C/ D .- D .E/ .E/|EF-'FG|.('C/E/G/c/) .(c/G/E/C/)|-C2 z2|]
```

2.1.7 Tuplets: (n

Triplets, quadruplets, etc. are coded with an open left parenthesis, immediately followed by the number of notes, then by the notes.

More precisely, the notation is:

- (2:2 notes in the time of 3
- (3:3 notes in the time of 2
- (4:4 notes in the time of 3
- (5: 5 notes in the time of $\langle n \rangle$ (see below)
- (6: 6 notes in the time of 2
- (7: 7 notes in the time of $\langle n \rangle$
- (8:8 notes in the time of 3
- (9: 9 notes in the time of $\langle n \rangle$

The notes in a tuplet must have the same length. If the tune metre is compound, that is 6/8, 9/8, 12/8 etc., $\langle n \rangle$ is 3; otherwise, it is 2.

More complex tuplets are coded using the extended notation $(\langle n \rangle : \langle t \rangle : \langle x \rangle)$, which means: put $\langle n \rangle$ notes into the time of $\langle t \rangle$ for the next $\langle x \rangle$ notes. The first parameter is the number printed over the tuplet. Extended tuplets are used to include notes of different lengths in a tuplet.

If the second parameter is omitted, the syntax is equivalent to that of simple tuplets. If the third parameter is omitted, it is assumed to be equal to the first. To make things more interesting, nested tuplets are also possible! In fact, one of the notes can be replaced by a tuplet:

```
X: 1
M: 2/4
L: 1/8
K: C
(3cde e2 | (6cegczg (3czg |
(3:2:2G4c2 | (3:2:4G2A2Bc | (3:2:6(3GGGA2Bc |))
```

To fine-grain the printing of tuplet indications, please see Section 4.5.5.

₩ Warning

abcMIDI does not support nested tuplets, so you will not be able to hear them.

2.1.8 Chords: []

Chords are written enclosing the notes in square brackets; spaces between the brackets and the notes are not allowed. A chord behaves as a single note when you have to add dots, slurs, etc. That is, it can be preceded by a dot for staccato, or by a symbol, and so on. To tie two chords, each note is followed by —.

The duration of the chord notes can also be specified adding a number after the closing bracket.

```
X: 1
L: 1/4
K: C
CE [C2G] c| .[CEGc] [C2D2G2c2] ([C/E/G/c/] [E/a/B/e/]) |
D^FAd|[D^FAd] [D^FAd] [D^FAd] [C2-E2-G2-] [CEG] z|
```

Warning

Do not mistake chords for something completely different! If you want to get something like this:

please note that these are not chords, but different *voices* on the same staff. This will be the subject of Section 3.1.

Please note the chord in the first measure. Although abcm2ps will allow you to write chords containing notes of different length, doing so is not recommended because other ABC programs do not support this feature.

2.1.9 Lyrics: W: w:

Lyrics can be added at the end of the tune, or aligned with the notes under the staff. In the first case, at the end of the body you add lines that start with the W: (upper case) field, followed by the lyrics.

Note-aligned lyrics are obviously more complex to write. Immediately after a line of music, you write one or more lines that start with the w: (lower case) field, followed by the lyrics split in syllables. Alignment rules are:

- the character (hyphen) separates syllables of a word. If it is separated from the previous syllable by a space, a note is skipped. $\langle n \rangle$ characters separated from the previous syllable skip $\langle n \rangle$ notes. Spaces after the have no effect, and can be used for better legibility;
- | skips to the next measure;

- [(underscore) the last syllable is sung for an extra note, and a horizontal line is drawn;
- * skips a note;
- (tilde) joins two syllables under a note;
- \- inserts a character;
- \ continuation character; the next w: line continues the same line of lyrics.

The following tune is "Happy Birthday" in Italian:

```
X: 1
M: 3/4
K: F
C> C | D2C2F2 | E2-E z C> C | D2C2G2 | F2-F z C> C |
w: tan- ti~au- gu- ri a te,_ tan- ti~au- gu- ri a te, * tan- ti~au-
c2A2F2 | E2D z B> B | A2F2G2 | F6 |]
w: gu- ri fe- li- ci, tan- ti~au- gu- ri a te!
%
W: Tanti auguri a te, tanti auguri a te,
W: tanti auguri felici, tanti auguri a te!
```

Tanti auguri a te, tanti auguri a te, tanti auguri felici, tanti auguri a te!

Beware of the difference between - (hyphen) and _ (underscore). Usually, - is used to skip syllables within a word, while _ is used at the end of a word. For instance:

```
X: 1
L: 1/4
K: C
CDEF|GAGF|EFED|C/D/C/B,/ C2|
w: A ---ve___ Ma___ri ---a.
```

In the third measure, – (hyphen) should be used.

If a w: line contains digits, these will not be aligned with the notes but moved a bit to the left; this feature is used to enumerate subsequent w: lines. The digit must be followed by a $\tilde{}$ and joined with the following syllable. If you want to align digits with notes (i.e. for fingerings), all you have to do is insert a $\tilde{}$ character just before the number.

```
X: 1
L: 1/4
K: C
CDEF|GABc|c2z2|z4|
w: 1.~do re mi fa sol la si do doooo
w: 2.~~~la la la la 1 2 ~3 ~4 laaaa
```

Accidentals can be written in all strings, including w: lines, using special codes: $\201$ prints \sharp , $\202$ prints \flat , and $\203$ prints \sharp .

Very important!

Take special care to write a number of syllables that matches the number of notes! Mismatch between notes and syllables is one of the most common causes of error.

2.1.10 Foreign Characters

As long as you write lyrics in English, no problem. Things may get tricky when you have to write lyrics in foreign languages like Italian, German, Hungarian... you will need accented characters that don't appear on standard US keyboards.

The problem is solved by using special character sequences: you start with \,, then a special character, then the character to be altered. These sets of characters are called *backslash sequences*. It is easier to do than to explain: please see Table 2.1. Note the difference between the acute ' (ASCII 39) and grave ' (ASCII 96) accents.

A complete table of symbols is shown in Appendix A.4.

Letter	Sequence
àèáé	\`a\`e\ ' a\ ' e
Üüëö	\"U \"u \"e \"o
Ññ	\~N \~n
βøØåÅ	\ss \/o \/O \aa \AA
ÔôçÇ	\^0 \^o \cc \cC
ÆŒæœ	\AE \OE \ae \oe

Table 2.1: How to obtain characters of foreign languages.

Typing Accented Letters: Beware!

Let's suppose that your computer keyboard, like mine, provides accented letters: you'll want to use them instead of backslash sequences. There's a catch, though.

As a matter of fact, not all characters were created equal. Different computers employ different character encodings: Unicode UTF-8, ISO-8859, and many others. A .abc file encoded in, say, UTF-8, could be partially unreadable on computers that use an ISO encoding; or vice versa. The problems lies the accented letters and special characters.

Fortunately, abcm2ps can cope with files encoded in both UTF-8/16 and ISO-8859. It also accepts 16-bit Unicode sequences; for example, \U0024 produces \$.

ISO-8859 is currently used by EasyABC, while many editors use UTF-8. At the end of the day the encoding doesn't matter, as long as you don't want to share your files.

If you're in doubt, type accented letters using backslash sequences: it's the safest option.

2.1.11 Grace Notes: ~ {}

The ___ (tilde) character denotes a *generic gracing*. Its meaning and method of execution depend on the player's interpretation. For instance, a fiddler may play a roll or a cut.

To notate grace notes, one or more notes are enclosed in curly brackets before the main note. To add a slash to a grace note (*acciaccatura*), the open curly bracket is followed by /, then by a single note. Grace notes can also be written without tying them to a note.

A grace note length can also be specified. (Music theorists need not apply....) The grace note length does not depend on L: or M:; it is always 1/8 for a single grace note, 1/16 for two or more, and 1/32 in bagpipe tunes.²

Chords can also be specified instead of a single grace note; currently, abc2midi can't play these "grace chords".

To remove the slur joining grace notes to the main note, you use the -G option of abcm2ps, or a formatting parameter that we'll see later.

2.1.12 Forcing Line Breaks: !

If you don't use the -c option of abcm2ps, you can force staff breaks with a single! character. In the next example, we will get two lines of music: the first with two measures, the second

²abcm2ps has special support for Great Highland Bagpipe music, to be explained someday.

with four:

```
X: 1
L: 1/4
K: C
CDEF|GABc|! CDEF|GABc|cdef|gabc'|
```

Needless to say, the above score looks awful... forcing line breaks should be done with care to avoid ugly results.

2.1.13 Avoiding Line Breaks: \

Mor -ning bells are rin -ging,

Usually, $\langle n \rangle$ measures in a source line produce $\langle n \rangle$ measures in the score. Sometimes is not convenient to write, say, six measures on the same line, because the source becomes less readable. In such cases, the $\langle n \rangle$ character can be added to the end of a line to indicate that the staff is to be continued. Similarly, a lyrics line (w:) may be broken into several lines in the same manner. The first part of a music line that ends in $\langle n \rangle$ must be followed by the corresponding w: line, if any.

The following example yields two staves, four measures each. Do not use the -c switch:

```
X: 1
L: 1/4
K: C
CDEC|CDEC|EFGz| % continues
w: Are you slee-ping, Are you slee-ping, Bro-ther John! % continues
EFGz|
w: Bro-ther John!
G/ A/ G/ F/ EC|G/ A/ G/ F/ EC| % continues
w: Mor-ning bells are rin-ging, Mor-ning bells are rin-ging, % continues
DG,Cz|DG,Cz|]
w: ding ding dong, ding ding dong!
Are you slee -ping, Are you slee -ping, Bro -ther John!
Bro -ther John!
```

Mor -ning bells are rin -ging,

ding ding dong,

ding ding dong!

25

2.1.14 Inline Fields

When one wants to change metre or other music properties, a new field is entered on a line on its own. However, there's another method that avoids splitting the music into lines: *inline fields*.

Inline fields are inserted enclosing a field in square brackets, with no leading and trailing spaces. Inline fields are used in this example to change the note length and the meter:

```
X: 1
L: 1/4
M: C
K: C
CDEF|GABc| [M:6/8][L:1/8] CDE FFF|GAB c2 z|
```

2.2 Music Properties

2.2.1 Key signatures and Clefs: K:

So far, we have written our examples in treble clef and C major scale. The K: field may be used to alter both the key signature and the clef.

Key Signatures

K: must be followed by a note name in upper case, followed by m or min when the mode is minor. Accidentals are written as # for \sharp and b for \flat ; e.g. Bb, or F#m. When there are no accidentals, the keyword none may also be used.

I remind you the simple rule to find out the major key according to the number of sharps or flats: *one tone* higher than the last sharp note, or *one fourth* below the last flat note. For your convenience, Table 2.2 shows the keys that correspond to a specified number of sharps or flats.

Peculiar key signatures are K: HP and K: Hp, which are used for Great Highland Bagpipe music. K: Hp marks the staff with $F\sharp$, $C\sharp$ and $G\flat$; both force note beams to go downwards.

Western classical music only uses major and minor modes, but others exist that are still used in other musical traditions. A case in point is Irish traditional music, which widely employs *modal scales*. I am not going to explain what they are; suffice it to say that you may come across strange key signatures such as AMix or EDor, that is "A Mixolydian" and "E Dorian". Table 2.3 lists them all.

Explicit accidentals can also be specified by appending them to the key signature. For example, $K:D \exp = c \circ g$ would set the key of D major but mark every C as natural, and every G as sharp. Lower case letters must be used, separated by spaces. When present, explicit accidentals always override the accidentals in the key signature.

³The keyword exp may be omitted, but abc2midi needs it.

Keys with sharps	Keys with flats		
none: C (Am) none			
1 sharp: G (Em)	1 flat: F (Dm)		
2 sharps: D (Bm)	2 flats: Bb (Gm)		
3 sharps: A (F#m)	3 flats: E♭ (Cm)		
4 sharps: E (C♯m)	4 flats: A♭ (Fm)		
5 sharps: B (G#m)	5 flats: D♭ (B♭m)		
6 sharps: F# (D#m)	6 flats: G♭ (E♭m)		
7 sharps: C# (A#m)	7 flats: Cb (Abm)		

Table 2.2: Correspondence between the key and the number of sharps or flats.

Sharps / Flats	Major Ionian	Minor Aeolian	Mixolydian	Dorian	Phrygian	Lydian	Locrian
7 sharps	C#	A#m	G#Mix	D#Dor	E#Phr	F#Lyd	B#Loc
6 sharps	F#	D#m	C#Mix	G#Dor	A#Phr	BLyd	E#Loc
5 sharps	В	G#m	F#Mix	C#Dor	D#Phr	ELyd	A#Loc
4 sharps	E	C#m	BMix	F#Dor	G#Phr	ALyd	D#Loc
3 sharps	A	F#m	EMix	BDor	C#Phr	DLyd	G#Loc
2 sharps	D	Bm	AMix	EDor	F#Phr	GLyd	C#Loc
1 sharp	G	Em	DMix	ADor	BPhr	CLyd	F#Loc
0 sharps	С	Am	GMix	DDor	EPhr	FLyd	BLoc
1 flat	F	Dm	CMix	GDor	APhr	BbLyd	ELoc
2 flats	Bb	Gm	FMix	CDor	DPhr	EbLyd	ALoc
3 flats	Eb	Cm	BbMix	FDor	GPhr	AbLyd	DLoc
4 flats	Ab	Fm	EbMix	BbDor	CPhr	DbLyd	GLoc
5 flats	Db	Bbm	AbMix	EbDor	FPhr	GbLyd	CLoc
6 flats	Gb	Ebm	DbMix	AbDor	BbPhr	CbLyd	FLoc
7 flats	Cb	Abm	GbMix	DbDor	EbPhr	FbLyd	BbLoc

Table 2.3: Modal scales.

The keyword none, meaning "no accidentals", can also be used; e.g. K: G none.

Since many people don't have formal music training, I suggest that a comment be added after the K: field to indicate the number of accidentals: K: AMix % 2 sharps

All Seven Clefs

As we saw in Section 2.1.1, the clef is automatically set by abcm2ps according to the pitch of the notes it encounters. For example, if you start a tune with notes much below the staff (notes with commas), abcm2ps will select the bass clef. However, you can set the clef with the K: field at the start of the tune; you can also choose not to have any clef at all.

The general syntax of the K: field is:

 $K: \langle key \rangle [clef=] [clef type] [line number] [+8] [-8] [transpose=]$

Clef	Field		
Treble	К:	treble (default)	
Treble, 1 octave below	K:	treble-8	
Treble, 1 octave above	K:	treble+8	
Bass	K:	bass	
Baritone	K:	bass3	
Tenor	K:	alto4	
Alto	K:	alto	
Mezzosoprano	K:	alto2	
Soprano	K:	alto1	
no clef	K:	clef=none	
percussions	К:	perc	

Table 2.4: Clefs and associated K: fields.

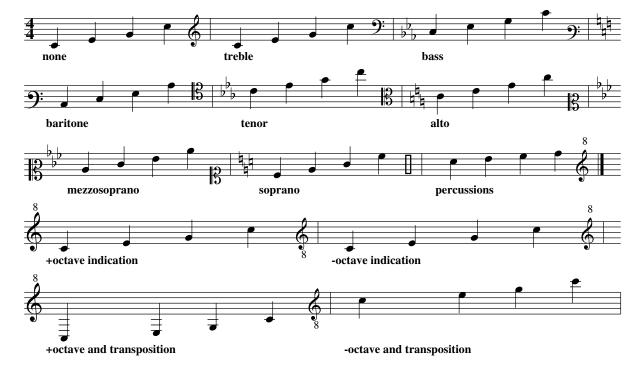

[$stafflines = \langle number \rangle$] [$staffscale = \langle number \rangle$]

where:

- clef= may be omitted before the clef type when it's not none;
- clef types can be:
 - a note pitch: G or g (treble clef), C or c (alto clef), F or f (bass clef) are allowed. The specified note will be positioned on the relevant line, as explained below:
 - a clef name: treble, alto, tenor, bass;
 - the kwyword none indicates that there is no clef;
 - the keyword perc (or, equivalently, the letter p) indicates a clef for percussion instruments.
- *(line number)* indicates the staff line on which the clef is drawn;
- +8 and -8 draws '8' above or below the staff;
- ^8 and _8 draws '8' above or below the staff, and performs octave transposition;
- transpose= (or t=) currently does nothing, but is supported by abcMIDI;
- stafflines= $\langle n \rangle$ sets the number of lines of the associated staff;
- staffscale= $\langle n \rangle$ sets the scale of the associated staff. Default is 1, maximum value is 3, minimum is 0.5.

To sum up, available clefs and the corresponding fields are listed in Table 2.4 and in the following example:

```
X: 1
L: 1/4
K: C clef=none
CEGc | [K: C treble] CEGc | [K: Cm bass]C,E,G,C |
w: none | treble | bass |
[K: C bass3]C,E,G,C | [K: Cm alto4]CEGc| [K: C alto]CEGc |
w: baritone | tenor | alto |
[K: Cm alto2]CEGc | [K: C alto1]CEGc | [K: perc] cdef |]
w: mezzosoprano | soprano | percussions |
w: +octave indication | octave indication |
[K: C treble^8] CEGc | [K: C treble_8] CEGc |
w: +octave and transposition * | octave and transposition * |
```

The \ in the example above are used to insert the next character literally, avoiding its special meaning; for example, \- will not produce a new syllable. (More details in Section 2.1.9.)

The following example shows how the very same notes can be set in different clefs using the octave field:

```
X: 1
M: C
L: 1/4
K: C clef=bass
%
CDEF|GABC||
K: C clef=F octave=-1
CDEF|GABc||
K: C clef=C
```

```
CDEF|GABc||
K: C clef=G octave=1
CDEF|GABc||
```

Bass and Alto Clefs Compatibility Issues

Previous versions of abcm2ps dealed with notes in bass and alto clefs in a peculiar way. abcm2ps could automatically transpose the music one or two octaves; besides, in bass clef the two notes c and C, could be equivalent, depending on the context.

This was quite confusing, and fortunately this scheme is now gone. However, problems may occur when you come across files that were written for the old scheme. You could see that some notes are printed one or two octaves higher than expected.

There are three ways to deal with these files:

- the long way: manually change every note to transpose it two octave lower, i.e. change c to C,;
- the quick and dirty way: include the following command at the beginning of the file: %%abc2pscompat 1
- the quick and correct way: specify the key using the appropriate clef= field.

I'll throw in a real-life example. A viola player asked me to transpose some Irish music from treble to alto clef. The right way to do it was changing the K: field from K: D to K: D alto, and adding the %%abc2pscompat 1 line before the tunes.

∠ Note

The <code>%%abc2pscompat</code> command starts with <code>%</code>, so it should be ignored as a comment. It is not the case; in fact, some commands start with <code>%%</code> and are called <code>meta-comments</code> or <code>pseudo-comments</code>. They are defined this way for compatibility reasons: applications that don't support certain advanced features of ABC can read the same source just ignoring the meta-comments. We shall examine meta-comments in detail in Section 4.1.

2.2.2 Metre: *M*:

The M: field specifies the tune metre in different ways:

- as a fraction, i.e. M: 4/4 or M: 3/4. Complex indications can be used, such as M: 5/4 (2/4+3/4) or M: 7/8 (3+2+2). There can be no space between digits and the + character;
- as an integer value: M:2;
- as a textual indication: M:C or M:C | denote the metre of 4/4 and cut time ("alla breve"). Ancient metre indications are also supported: M: o (perfect minor), M: o. (perfect major), M: c (imperfect minor), M: c. (imperfect major);
- as an explicit measure duration: M:C|=2/1;
- if there is no metre, use M:none.

Needless to say, the metre can change in the middle of a tune. In this case, you insert an inline M: field in the body:

```
X: 1
M: C
K: C
L: 1/4
C D E F |G A B c| [M: 3/4] c d e|f g a| [M: 2/4] b c'|cG|EC|
```

The recommended order of fields related to note length is M:, L:, and Q:.

2.2.3 Bars and Repeats: | / : []

In addition to the basic measure bar, others types of bars can be obtained using combinations of these characters: |, . , [,] , and : .

```
X: 1
L: 1/4
K: C
CDEF .| GFED [| CDEF |: GFED :| CDEF :: GFED || CDEF [|] GFED
CDEF |[| GFED :::|] CDEF : GFED |]
```

Please note that $[\ |\]$ prints nothing; it is an *invisible bar*, and it can be used as a placeholder for an ornament. The same can be accomplished using $[\]$. Also, note that : is the same as . |. To indicate that a section has two (or more) different repeats, use the symbols $[\ 1,\ [\ 2,\ \dots]$ as in the following example. When repeats symbols are close to a bar, they can be shortened using $[\ 1,\ 2,\ \dots]$ The end of the last repeat is set with $[\ 1,\ 0,\ \dots]$ if at the end of the tune.

```
X: 1
L: 1/4
K: C
|: C D E F | G F E D | [1 C2 G2 : |2 C2 C2 | | c3 z | ]
```

abcm2ps also supports other types of repeats. Not only digits, but also dots, commas, hyphen signs and text in double quotes can be used:

```
X: 1
L: 1/4
K: C
|: C D E F |1-3 c d e f : |4,5 C2 G2 : | ["last time" C G C z | ]
```

Most commonly, the start repeat bar |: is left out. This is not a problem in printed music, but abcMIDI is a bit more restrictive and expects to find it. In Section 2.2.8 we will see how to include |: in the source, but hide it in printed output.

₩ Warning

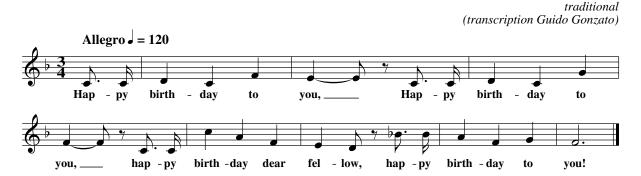

Unfortunately, repeats are one of the features that make abcm2ps and abcMIDI not compatible with each other. In the latter,

- to repeat a run of notes three times, |:: ::| will not work. A simple workaround is: |:|1-3 notes :|.
- text indications in repeat bars (as "last time" above) are not recognised.

2.2.4 Title, Composer, Tempo: T: C: Q:

Our scores still miss something... In the next example we introduce the T: (title, subtitle), C: (composer) and Q: (tempo) fields:

Happy Birthday (Tanti auguri a te)

The text indication in the Q: field ("Allegro" in our example) may be omitted. Besides, Q: also accepts references to previous tempos, as in Q: 3/8 = 1/4.

In Section 4.1 we will learn how to change the title fonts.

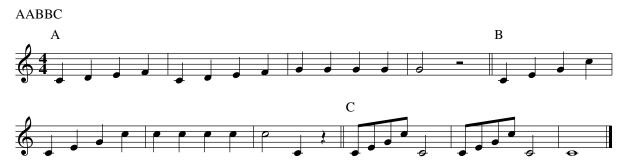

2.2.5 Parts: P:

Some tunes are made of different parts, possibly repeated in several ways. To specify the order in which parts are played, the P: field is used. In the header, this field specifies the order in which parts should be played; in the body, it marks the beginning of each part.

Part names must be upper-case letters, A... Z.

```
X: 1
T: Song in three parts
L: 1/4
P: AABBC % or: P: A2.B2.C
K: C
[P: A] C D E F|C D E F|G G G G|G2 z2||
[P: B] C E G c|C E G c|c c c c|c2 Cz||
[P: C] C/E/G/c/ C2|C/E/G/c/ C2|C4|]
```

Song in three parts

Note that when the P: field is used in the header, the part name may be followed by a number indicating the number of repeats. Thus, P:A3 is the same as P:AAA; P: (AB) 3C2 is equivalent to P:ABABABCC. To make the text more readable, dots may be used to separate the parts.

There you are a more complex example: P: ((AB) 3. (CD) 3) 2 is equivalent to P: ABABABCD-CDCDABABABCDCDCD. Try and count carefully!

Very important!

P: cannot be inserted within repeats (i.e. |:...:|), because abc2midi gets confused and produces wrong MIDI output.

2.2.6 Accompaniment Chords: ""

In many songbooks, accompaniment chords (say, for the guitar) are notated as "A", "C7", "Dm", "F#" etc. above the staff. Such chords are notated writing the chord name between double quotes " immediately before the note.

An accompaniment chord has this format:

⟨note⟩ [accidental] [type] [/bass note]

The note is A... G (upper case only;⁴) the accidental is indicated with # for \sharp , b for \flat , or = for natural; the chord type is one of those listed in Table 2.5.

A slash / followed by a note A... G denotes either an optional bass note, or a *chord inversion*. Spaces between the chord and the following note are not allowed. Chord inversion and optional bass notes are rendered by abc2midi; please refer to Section 5.1.7 for explanations.

```
X: 1
T: Happy Birthday
T: (version with chords)
C: traditional
M: 3/4
Q: "Allegro" 1/4 = 120 % tempo
K: F
C> C|"F"D2C2F2|"C"E3 z C> C|"C"D2C2G2|
w: Hap-py birth-day to you, Hap-py birth-day to
```

⁴lower case is possible, but not recommended; abcMIDI uses it

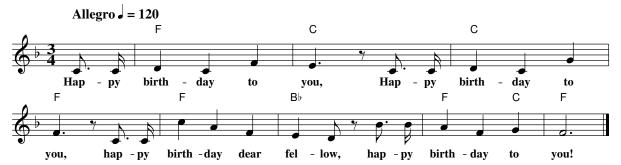

Type	Meaning
m or min	minor
maj	major
dim	diminished
+ or aug	augmented
sus	sustained
7, 9,	seventh, ninth, ecc.

Table 2.5: Types of accompaniment chords.

```
"F"F3 z C> C|"F"c2A2F2|"Bb"E2D z B> B|
w: you, hap-py birth-day dear fel-low, hap-py
"F"A2F2"C"G2|"F"F6|]
w: birth-day to you!
```

Happy Birthday (version with chords)

traditional

Very important!

If you need to write accompaniment chords using Italian notes, i.e. "Sol7" instead of "G7", don't write them this way. ABC requires that only notes in English notation be used; programs for translating sources into MIDI files conform to this standard. However, abcm2ps has a trick for printing accompaniment chords as Italian notes: please refer to Section 4.5.2.

Multiple chords per note are possible. They can be notated writing two or more consecutive chords before the same note, or using the separating characters; or n : n:

```
X: 1
M: 4/4
L: 1/4
K: C
%
"C""G"CCCC|"G""G7"GGGG|"C;C7"CCCC|]
```

Although \n is allowed, one should avoid using it and always employ; instead, since abc-2midi only supports the latter.

2.2.7 Text Annotations: "^_<>@"

Text annotations can be added in different ways. The first method is to write the annotation as an accompaniment chord; that is, enclosing it between double quotes, but preceding the text by a special character. Another method is to use the P: (part) field. Finally, Q: fields can be inserted to specify tempo changes.

Text annotations must begin with one of these special characters: $^- <> 0$. These characters set the logical difference between an annotation and an accompaniment chord, and specify the position of the annotation:

- ^ above the staff;
- _ below the staff;
- < to the left of the note;
- > to the right of the note;
- @ must be followed by two numbers X and Y, separated by a comma and optionally followed by a space. The annotation will be printed from the centre of the note head (the lowest note, if in a chord), with an offset of X horizontal and Y vertical points.

Very important!

A common mistake is writing text annotations leaving out one of the ^-<>@ characters. This "annotation" will be interpreted as an accompaniment chord, which will be almost certainly malformed and will wreak havoc in both printed and MIDI output.

To include accidentals in text annotations, use $\$, $\$, and $\$; note the leading $\$. Multiple annotations are notated like multiple chords, as seen in Section 2.2.6.

Let us see an example that uses all methods:

```
X: 1
Q: "Dolcemente" 1/4=60
L: 1/4
K: C
CDEF|[P:piano]GFED|"^above"CDEF|"_below"GFED|"<left"c'">right"A,DE|
[Q: "sostenuto"] FGC"@-15,5.7 anywhere"D|
```

Figured Bass

Most symbols of figured bass notation can be written using s: lines, containing text annotations instead of symbols:

```
X: 1
T: Figured Bass
M: none
L: 1/4
K: C bass
%
C,4 C,4 C,4 C,4 C,4 C,4 C,4 C,4 C,4]
s: "_6;4" "_#" "_6;" "_6+" "_6-" "_-" "_\\6" "_/6" "_6 4"
```

Figured Bass

Please note that all annotations have a leading (underscore) character, so they are printed below the staff.

2.2.8 Ornaments: !symbol!

Ornaments are notated using the general form !symbol!: the ornament name (ff, ppp, cresc...) enclosed in exclamation marks. Ornaments, also known as "embellishments" or "decorations", are written immediately before the note; two or more ornaments per note are possible. Most ornaments can also be applied to grace notes or measure bars.

```
X: 1
M: 4/4
L: 1/4
K: C
%
!p!GGG!>!!f!G|!segno!GG!trill!G2|!coda!GGG!fine!G|
```

As shown above, some symbols are printed above the staff by default, while others are printed under the staff. Forcing ornaments under or above the staff is possible; please refer to Section 4.1.

Supported ornaments are listed in Figure 2.1. You will probably notice that some symbols you need are missing. Don't worry: new symbols can be added, as we will see in Section 4.5.

Figure 2.1: Standard expression symbols.

If the tune contains many ornaments, an alternative notation may be handy. After a line of music, one writes a line that starts with the s: field (or, equivalently, d:). This line will contain only symbols.

Rules for matching notes and symbols are those explained in Section 2.1.9. s: lines and note-linked symbols can be used at the same time.

```
X: 1
L: 1/4
K: C
C/D/ E/F/ G/A/ B/c/|c/B/ A/G/ F/E/ D/C/|e2!fermata!c2|z4|]
s: !>! !>! * !ff! !p! !mp! * !ff! !>! !>! !ff! * * * !ff! |
```

While most symbols just print something over a note and are self-explanatory, some of them act on multiple notes or other printed elements:

- symbols that include an open parenthesis (in their definition start a multi-note ornament, which is ended by the corresponding symbol with a closed parenthesis). For example, !<(! starts a crescendo hairpin, !<)! ends it. The same holds for !>(!, !>)!, and their long-name counterparts;
- !beambr1! and !beambr2! act on notes connected by beams, leaving only 1 or 2 beams;
- !beamon! prevents a beam from being broken across measures;
- !invisible! makes the next note or measure bar invisible;
- finally, !xstem! will be explained in Section 4.1.2.

The following tune shows a three-times repeat with a hidden start repeat bar:

```
X: 1
M: 4/4
L: 1/4
K: C
GGGG !invisible!|: |1-3 CDEF |G!rbstop!ABc:|
```

2.2.9 Redefinable Symbols: U:

Most symbol names are quite verbose, and may make the source difficult to read. To solve this snag, you can assign a single letter to a symbol using the U: field.

The field is followed by an upper-case letter from $\mbox{\tt H}$ to $\mbox{\tt Y}$ or by a lower-case letter from $\mbox{\tt h}$ to $\mbox{\tt y}$, then by $\mbox{\tt =}$, then by the symbol. For example, the following $\mbox{\tt U}$: fields define $\mbox{\tt T}$ as equivalent to !trill!, $\mbox{\tt H}$ to !fermata!, and $\mbox{\tt M}$ to !tenuto!:

Abbreviation	Symbol
u	!upbow!
V	!downbow!
T	!trill!
Н	!fermata!
L	!accent! or
	!emphasis!
M	!lowermordent!
P	!uppermordent!
S	!segno!
0	!coda!

Table 2.6: Standard abbreviations for common symbols.

```
U: T = !trill!
U: H = !fermata!
U: M = !tenuto!
```

To reset the definition of a U: field, you use a definition like:

```
U: T = !nil!
U: H = !nil!
U: M = !nil!
```

The letters uvTHLMPSO are predefined abbreviations for common symbols; definitions are shown in Table 2.6.

2.2.10 Information Fields

In Section 1.2.3 I explained that ABC files may contain several tunes. This feature, together with the ease of use of ABC, spurred the creation of many ABC music archives on the Internet. As stated before, ABC has become *the* standard to spread folk and traditional music.

There are fields for describing tune properties such as the source area, rhythm, annotations, and more. These information fields can be used when browsing a database for a special kind of music. If you contribute ABC files to public sites such as http://www.thesession.org/, it might be a good idea to include at least the 0:, R:, and D: fields.

A: area. Used to specify an area within the country where the tunes originates. Example: A:Dublin

```
B: book. Example: B:Francis O'Neill: "The Dance Music of Ireland" (1907)
```

D: discography. Example: D: "The Chieftains 4" by The Chieftains

F: file name. Example: F:DrowsyMaggie.abc

- **G:** group. Usually used to specify the instrument on which the tune is played. Example: G:-whistle, flute
- H: history. Example: H:this tune was collected by...
- I: information. Example: I:version without ornamentation. The I: field can also replace command lines, see Section 4.1.1.
- N: notes. Example: N:sometimes spelt "Drowsey Maggie"
- O: origin. Used to specify the country of origin of the tune. Example: O:Ireland
- **R:** rhythm. Example: R:Reel
- **S:** source. Used to specify where the ABC tune was found. Example: S: from John Chambers' site
- Z: transcription notes. Example: Z: Transcribed in C, originally in D

All of these fields can be printed in titles by means of the %%titleformat command, or after the tunes by using %%writehistory and %%infoname.

uuuuuuu

Chapter 3

Harmony

3.1 Polyphony in ABC

S O far, we only have seen melodies: music written for a single voice or instrument. This is all that ABC 1.6 is able to do—and it is a lot: folk musicians do not need anything more. Let us now turn our attention to ABC 2 and its extensions for polyphonic music, using choral pieces for our examples.

3.1.1 Voices and Systems: *V*:

Let us review a bit of music theory. There can be one or more lines of music on a staff; that is, one or more *voices*. Voices belong to one or more *instruments*, some of which have a single voice (e.g. woodwinds) or more than one (piano, organ). A set of staves related to instruments that play together in the piece is called a *system*.

∧ Note

abcm2ps allows to typeset music for up to 16 voices, but this limitation can be easily overcome modifying and recompiling the program sources. Ask your local geek.

We will begin by writing a piece for two voices on two staves. The V: field, followed by a voice name, indicates that the following music belongs to that voice. The voice name may be a number or a string (e.g. "Tenor"). The V: field can be written on a line by itself, or enclosed in square brackets at the start of a note line.

```
X: 1
T: Brother John
C: Traditional
L: 1/4
K:E
V: 1
EFGE|EFGE|GABz|GABz|B/c/B/A/GE|B/c/B/A/GE|
V: 2
z4 |z4 |EFGE|EFGE|GABz |GABz |GABz |
```

```
V: 1
FB, Ez | FB, Ez | z4 | z4 |
V: 2
B/c/B/A/ GE|B/c/B/A/ GE|FB, Ez|FB, Ez|
```

Brother John

Traditional

This score was written alternating the lines of voices 1 and 2, as in real sheet music. We could have written all of the music of voice 1, then all of voice 2: the result would have been the same.

Warning

In multivoice tunes, the P: field must be indicated in the top voice.

We can add some declarations in the header that specify the properties of each voice. The syntax is:

V: $\langle voice\ name \rangle\ [clef=]\ [clef\ type]\ [name=]\ [sname=]\ [merge]\ [stem=]\ [up\ |\ down\ |\ auto]\ [gchord=]\ [up\ |\ down\ |\ auto]\ [gchord=]\ [up\ |\ down\ |\ auto]\ [scale=]\ [staffscale=]\ [stafflines=]$

The voice name may be a digit or a word (e.g. "Tenor"). Possible definitions are:

- clef= specifies the clef of the voice; you use the same parameters examined in Section 2.2.1.
- name= $\langle name \rangle$ or nm= $\langle name \rangle$ specifies the name that appears at the left of the first staff.
- sname= $\langle name \rangle$ or snm= $\langle name \rangle$ specifies the name that appears at the left of all the staves after the first one.
- merge indicates that this voice belongs to the same staff as the previous voice.
- stem= up, down, or auto forces the note stem direction. The stem= keyword may be omitted.

- gstem= $\langle up \rangle$, down or auto forces the grace note stem direction.
- dyn= $\langle up \rangle$, down or auto forces the placement of dynamics marks.
- lyrics= $\langle up \rangle$, down or auto forces the placement of lyrics lines.
- gchord= $\langle up \rangle$ or down forces the placement of accompaniment chords.
- scale= $\langle n \rangle$ sets the scale of the voice. Default is 1, maximum value is 2, minimum is 0.5.
- staffscale= $\langle n \rangle$ sets the scale of the voice and the associated staff. Default is 1, maximum value is 3, minimum is 0.5.
- stafflines= $\langle n \rangle$ sets the number of lines of the associated staff.

All of these fields are optional. Here is the same tune with some improvements:

```
X: 1
T: Brother John
C: Traditional
L: 1/4
V: 1 clef=treble name="Soprano" sname="S"
V: 2 clef=treble name="Contralto" sname="VB"
K: E
%
[V: 1] EFGE|EFGE|GABz|GABz|B/c/B/A/ GE|B/c/B/A/ GE|
[V: 2] z4 |z4 |EFGE|EFGE|GABz |GABz |
%
[V: 1] FB,Ez |FB,Ez |z4 |z4 |
[V: 2] B/c/B/A/ GE|B/c/B/A/ GE|FB,Ez|FB,Ez|
```

Brother John

Fancy staves can be obtained using staffscale and stafflines. Percussion notes (cross-shaped note heads) are obtained using sharps:

Special Staves

3.1.2 Positioning Voices: %%score

A polyphonic piece is played by several instruments, which have one or two staves associated to them. One or more voices belong to each staff. To specify how voices and instruments are positioned on the score, you use the %%score command.

The %%score command must be followed by voice names, optionally enclosed by a pair of delimiters: [], {}, and (). As other commands in the header, %%score must appear before K:. In the tune body, if voices exist that were not declared in the header, they will be ignored.

The delimiters are used following these rules:

- when voices are not enclosed by any delimiter, they will be simply printed on separate staves. The uppermost voice in the system will be the first voice in the list. For example: %%score SATB
- when two or more voices are enclosed in square brackets, their staves will be joined by a thick bracket. This arrangement is often used for the choral part of a system. For example: %%score [SATB]
- when two or more voices are enclosed in curly brackets, their staves will be joined by a bracket. This is typically used for the piano or organ part of a system: %%score {MS MD}

- if two or more voices are enclosed between parentheses, they will be printed on the same staff. For example: %%score [(SA) (TB)]
- to add measure bars that cross the staves, use the character | between voice names: %%score [S|A|T|B]

When two voices are printed on the same staff, the stem direction indicates the first voice (up) or the second (down).

Here is an example of piano music. There are three voices, two of which are played with the left hand. When one of these voices is silent, normal rests are replaced by invisible rests we studied in Section 2.1.3.

Studio Op. 10 - N. 3

Let us now try a more complex piece. These are the first four measures of Mozart's famous "Ave Verum", for organ and SATB:

```
X: 1
T: Ave Verum
C: W. A. Mozart
M: 4/4
```

W. A. Mozart

Soprano

Tenore Basso

Organo

```
L: 1/4
Q: "Adagio"
%%score [(S A) | (T B)] | (MD1 MD2) | (MS1 MS2)
V: S clef=treble name="Soprano" sname="S"
V: A clef=treble name="Alto" sname="A"
V: T clef=bass name="Tenore" sname="T"
V: B clef=bass name="Basso" sname="B"
V: MD1 clef=treble name="Organo"
V: MD2 clef=treble
V: MS1 clef=bass
V: MS2 clef=bass
K: D
[V: MD1] (DA,D[CE]) | ([DF]D[DF][EG]) | [FA][DF][Fd][DF] | A^G=GG
[V: MD2] x4
                                                       |E4
[V: MS1] F,2F,A,
                   |A,F,A,2-
                                     |A,4
                                                       |B,4
                                     |D,4-
[V: MS2] D,4-
                   |D,4-
                                                       |D,4|
[V: B] z4
                    |z4
                                     |D,2D,2
                                                       |D,2D,2
w: A- ve, A- ve,
[V: T] z4
                                                       |B,2B,2
                    |z4
                                     |A, 2A, 2|
[V: A] z4
                    | z4
                                     |F2F2
                                                       |E2E2
[V: S] z4
                    1z4
                                     |A2 (dF)
                                                       | (A^G) = G2 |
w: A- ve, * A - ve,
```

Ave Verum

Note that the voices were intentionally written in reverse order. The %%staves command rearranged staves and voices in the right order. Normally, you will want to write voices in the same order as specified in %%staves.

∧ Note

The %%staves command is a strong point of the ABC notation compared to graphical programs. For example, in a four voice score laid out for SATB, you only need to modify the %%staves command to change the layout to two staves, two voices per staff. With most graphical programs, you would have to rewrite the score from scratch!

In general, writing the voices in the same order as they appear in a real score is preferable.

As a last example, a piece written in an unusual manner: the "Kyrie" from Andrea Gabrieli's Missa Brevis. This music has no metre, and each voice follows its own tempo: in this situation M:none must be used. The length of each measure is different for each voice, consequently the !longphrase! symbol replaces measure bars. We also want "cut time" tempo indicated. This is how the piece is written:

```
%%topmargin 2cm
%%scale 0.7
%%leftmargin 1cm
%%rightmargin 1cm
%%squarebreve 1
X: 1
T: Missa Brevis
C: Andrea Gabrieli (1510? - 1586)
M: C|
L: 1/4

Missa Brevis

Andrea Gabrieli (1510? - 1586)

3.1.3 Voice Splitting (Overlay): &

In some pieces of music, a voice splits in two in some measures only. To avoid introducing an additional and almost identical voice, you can use the & symbol. When placed within a measure, it splits the current voice and attributes the notes that follow to the "second" voice. This is also called "voice overlay".

To end a voice overlay, use &). You can also add multiple overlay voices extending for several measures. A multiple measure overlay begins with (&), voices are added with &, and sequence ends with &.

The above piece can be equivalently written as:

```
X: 1
L: 1/4
%%score (1 2)
K: C
[V:1] C>CE>E|G>GG2|C>CE>E|G>Gc2|
[V:2] x4   |G2E2 |x4  |x2E2 |
```

which is more verbose.

3.1.4 Change of System

In pieces of some complexity (say, for soloist, choir, and orchestra), not all instruments play at the same time. Writing all parts, mostly containing rests, would be a waste of time and space when only one instrument is playing.

The %%staves field can be changed as needed, specifying only the voices that are actually playing. Here is as example "Riu riu chiu", a well-known 16th century *villancico*. The result is shown in Figure 3.1.

The %%vskip 0 command is used to make a small vertical break between parts. %%vskip always inserts a break, even if one specifies 0.

Please note that strange $\241$ in the title. It is the octal code of the ; character: we will cover this topic in Appendix A.4.

```

w: car: ni~aun o-ri-gi-nal e-sta Vir-gen no tu-vie-ra.
```

There's an alternate way to write pieces with a variable number of voices. The command %%staffnonote 0 hides the voices that don't contain notes:

```
X: 1
M: 4/4
L: 1/4
%%staves [S | A | T]
V: S name="Soprano" sname="S"
V: A name="Alto" sname="A"
V: T name="Tenor" sname="T"
K: G
%%staffnonote 0
[V: S] GABc|GABc|GABc|B3z|
[V: A] GGGG|BBBB|GGGG|D3z|
[V: T] GDGD|GDGD|GGDD|G3z|
%
[V: S] GABc|dcBA|GABc|d3z|
```

Figure 3.1: A piece where the system changes twice.

As you can see, the source is greatly simplified. The disadvantage of this method is that you must write the source specifying an exact number of bars per line. (e.g. you can't use the -c switch).

uuuuuuu

Chapter 4

Page Layout

4.1 Formatting Parameters

WE have learned how to write polyphonic music. Now we will want to set the page layout, the fonts, etc. abcm2ps has several commands for customising formatting parameters. These commands are written in the source as meta-comments, or in external files known as *format files*. See Section 4.2.

Meta-comments (from now on, *commands*) are lines that start with %%, like %%staves. These are written in the header or in the body. There exist several commands: some specify the page layout, fonts, spacing, and so on. Many commands accept a parameter of one of these types:

- a *unit of length* in centimeters (cm), inches (in), or points (pt): for instance, 30pt, 1cm, 0.3in;
- a *logical value* "yes or no", expressed using the words true or false or, equivalently, with 1 or 0;
- a string, like Times-Roman 24;
- a *number*, either integer or real (that is, with decimals).

I remind you that a "point" (PostScript point) is 0.3527 mm.

Let us now see a rather complete example. The following piece (the first ten measures of Mozart's Ave Verum) contains the most commonly used commands:

```
% PAGE LAYOUT
%%pageheight
                 29.7cm
%%pagewidth
                 21cm
%%topmargin
                 1cm
%%botmargin
                 1cm
%%leftmargin
                 1cm
%%rightmargin
                 1cm
% SPACING
%%topspace
                 0cm
                          % space before the piece
```

```
0cm % space before the title
%%titlespace
%%subtitlespace 0.2cm % space before the subtitle
%%composerspace 0.5cm % space before the composer line
%%musicspace 0.5cm % space before the first staff
%%vocalspace
               1.5cm % additional space after lyrics lines
%%sysstaffsep
               1cm % space between staves in the same system
%%staffsep
                2cm
                      % space between different systems
% FONT

```

Ave Verum per coro e organo

W. A. Mozart (1756-1791)

Figure 4.1: Ave Verum with formatting parameters.

The result is shown in Figure 4.1. Quite a big change, isn't it? The difference should be clear. A complete list of available commands is presented in Appendix A.5.

4.1.1 Changing Parameters

Once the parameters are set, their values remain the same throughout the entire piece. But of course, parameters can be redefined in the body of the tune.

There are two ways to change a parameter: either write a new command line, or an equivalent I: inline field. This field accepts a special syntax that has the same effect of a command, with the additional advantage of being able to appear anywhere in the tune body. For example, I: vocalfont Times-Roman 12 is equivalent to %%vocalfont Times-Roman 12.

Let's use both methods to change the vocalfont parameter in a tune:

ERROR!

```
X: 1
T: Silent Night
C: F. Gruber
M: 3/4
Q: "Andante tranquillo"
K: C
%
G>A G E3|G>A G E3|d2 d B2 B|c2 c G3|
%%vocalfont Times-Roman 12
w: A- stro del ciel, Par- gol di- vin, w: mi- te~A- gnel- lo re- den- tor!
%%vocalfont Times-Italic 12
w: Voi- ci No- ël, ô dou- ce nuit! w: L'é- toile~est là qui nous con- duit.
%%vocalfont Times-Roman 12
w: Si - lent night! Ho - ly night! All is calm,_ all is bright.
```

Silent Night

F. Gruber

This method can also be used to change the font in the same line:

```
%%font Helvetica
%%font Helvetica-BoldOblique
X: 1
L: 1/4
K: C
CDEF|!ff!GAB!fermata!c|!mf!cBAG|!p!FED!fermata!C|
%%vocalfont Helvetica 12
```

```
w: la la la %%vocalfont Helvetica-BoldOblique 13w: la la la la la la la %%vocalfont Helvetica 12w: la la la la.
```

A better way to change fonts will be explained in Section 4.1.3.

4.1.2 The Grand Staff

In piano music, the most commonly used system consists of two staves. Notes and stems are allowed to cross them.

The I: staff $\langle n \rangle$ field is used to force the position of notes on a specific staff, while !xstem! draws a stem up to the note on the previous staff. Top and bottom staves are numbered 1 and 2.

```
X:1
M:C
L:1/4
U: m = !xstem!
K:none
%%score 1 2
V:1
cc//c//c//c2 | [CEGc]2[CEGc]2|
V:2 bass

V:2
C,/E,/[I: staff 1]G/[I: staff 1]c/ z2|z4|]
```

4.1.3 Using Fonts and Text

abcm2ps supports nearly all PostScript fonts, which are listed in Appendix A.7. Three fonts are especially important: Times, Helvetica, and Courier; all of them have italics and bold variants.

Times is equivalent to Windows' Times New Roman, Helvetica is equivalent to Arial, and Courier to Courier New.

These are predefined fonts, which you can use anytime with any font command. To use other fonts, you have to *declare* them inserting the %%font command at the top of the source. Text-related commands are:

- %%font declares a font;
- %%textfont sets a font;
- %%begintext...%%endtext define a range of text lines, which must start with %%;
- %%center centers some text;
- %%vskip inserts the specified vertical space;
- %%sep inserts a short separator.

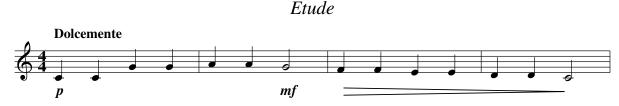

Here is an example that demonstrates abcm2ps's capability of alternating text in different fonts with pieces of music. The result is shown in Figure 4.2.

```
% declare non-predefined fonts
%%font AvantGarde-Book
%%font Bookman-Light
%%titlefont Times-Italic 21
%%musicspace -0.5cm
%%textfont Helvetica 26
%%center Typesetting example
%%vskip 0.4cm
%%textfont Bookman-Light 14
%%begintext justify
%%This is an example of text inserted into an ABC file. This abcm2ps

%%sep 0.4cm 0.4cm 6cm
% the following line increases the character size
%%textfont * 20
%%center End of the example.
%%sep 0.4cm 0.4cm 6cm
```

Typesetting example

This is an example of text inserted into an ABC file. This abcm2ps feature allows for the writing of songbooks, music collections or other publications without having to resort to a word processor. Not bad, is it? Now let's write a brief musical example.

Now we'll have a look at something more lively. To start with, let's switch fonts: from Bookman-Light to AvantGarde-Book. Here is the same Etude with a few small variations to make it more interesting:

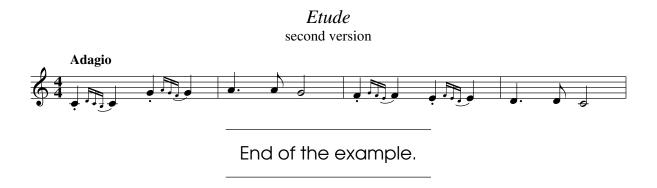

Figure 4.2: Alternating text with music.

∠ Note

Virtually all printed music uses Times-Roman or an equivalent font. However, Helvetica is more readable at equal font size.

To use different fonts in string, you specify an alternate set of fonts with the commands <code>%%set-font-1</code>, <code>%%setfont-2</code>, <code>%%setfont-3</code>, and <code>%%setfont-4</code>, followed by a font name and a font size in points. These can be referred to in strings as \$1 \$2 \$3 \$4, and have the effect of changing the text font:

```
%%setfont-1 Times-Roman 20
%%setfont-2 Times-Italic 26
%%setfont-3 Helvetica-Bold 18
%%setfont-4 AvantGarde-Demi 24
X: 1
K: C
%%text Hello. This is the default font, $1this is font 1,
%%text $2this is font 2, $3this is font 3, $4this is font 4,
%%text $4and now $0let's go back to default font.
CDEFGABc|cdefgabc'|CCDDEEFF|GGAABBcc|
W: It also works in $3W: fields!
W: It's useful to emphasise $0some parts.
```

Hello. This is the default font, this is font 1, this is font 2, this is font 3, this is font 4, and now let's go back to default font.

It also works in W: fields! It's useful to emphasise some parts.

Figure 4.3: Using different fonts in strings

4.1.4 Voice Scale

Sometimes, one wants to print a voice smaller than others. This can be accomplished using the I: voicescale command, as in the following example:

```
X: 1
C:
M: 4/4
L: 1/4
```

```
%%score (S T)
K: C
%
% let's make voice S smaller
[V: S] [I: voicescale 0.6] g2 g2|g2 g2|
[V: T] CDEF|GABc|
[V: S] f2 f2|e2 z2|
[V: T] cBAG|FEDC|
```

4.1.5 Staff Breaks

To give an indication at the beginning of a piece (for example, the original key signature and extension), or write a coda, the staff can be interrupted with the %%staffbreak command:

```
X: 1
L: 1/4
K: C alto4
%
[C,0G0] %%staffbreak 0.3cm "f"
K: C treble
CCEE|GGcc|"^al coda"ccee!coda!|fgc2| %%staffbreak 1.5cm
!coda!g2C2|]
```

The letter f that follows %%staffbreak means that the staff break is forced even if it occurs at the beginning or end of a line.

If the staff is part of a system, then the staff break must be applied to all staves in the system.

4.1.6 Multi-column Output

Text and music can be laid out in multiple columns. The %%multicol start, %%multicol new and %%multicol end commands define the columns.

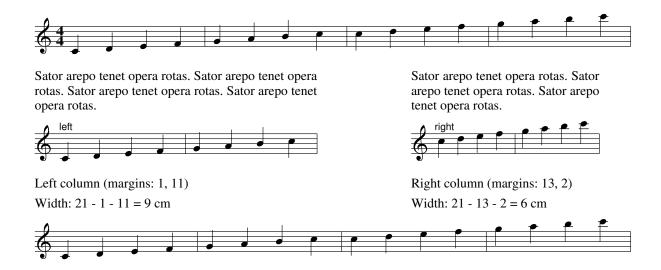

%%multicol start saves the current page margins and sets the vertical position for the beginning of a column. At this point you can change the margins and print the material in the first column.

%%multicol new moves the vertical position to the beginning of a new column, resetting the margins. Change the margins again and print the material in this new column. This sequence may be repeated as many times as you wish.

Finally, %%multicol end reinitializes the page margins to the values prior to %%multicol start and moves the horizontal position below the columns that were printed.

It sounds difficult, doesn't it? Don't worry, it is easier than it sounds. Here is an example:

```
%%pagewidth 21cm
%%leftmargin 1cm
%%rightmargin 1cm
X: 1
L: 1/4
K: C
CDEF | GABc | cdef | gabc' |
%%multicol start
%%rightmargin 11cm
%%begintext justify
%%Sator arepo tenet opera rotas. Sator arepo tenet opera rotas.
%%Sator arepo tenet opera rotas. Sator arepo tenet opera rotas.
%%endtext
"^left"CDEF|GABc|
%%text Left column (margins: 1, 11)
%text Width: 21 - 1 - 11 = 9 cm
%%multicol new
%%leftmargin 13cm
%%rightmargin 2cm
%%begintext justify
%%Sator arepo tenet opera rotas. Sator arepo tenet opera rotas.
%%Sator arepo tenet opera rotas.
%%endtext
"^right"cdef|gabc'|
%%text Right column (margins: 13, 2)
%text Width: 21 - 13 - 2 = 6 cm
%%multicol end
CDEF | GABc | cdef | gabc ' |
```

4.1.7 Customising Titles

In addition to the plain T: line(s), the tune title may be composed by several fields.

Complex titles are specified using <code>%%titleformat</code>, followed by a set of letters, digits, and commas. Letters refer to ABC fields, and may be anything in the range $A \dots Z$; the corresponding field will be printed. Digits may follow a letter, meaning "0" for centre, "1" for right align, or "-1" for left align. A comma , forces a newline, and unrecognized characters are ignored.

```
% title format T-1 R1, T-1 T-1 C1, H1
X: 1
T: First Title
T: Second Title
T: Last Title, The
C: Anonymous
H: Written many many years ago...
L: 1/4
R: march
K: C
CDEF | GABc | CDEF | GABc | ]
```

Note the strange third title. As you can see, it was rearranged to read "The Last Title". Whenever abcm2ps finds that the last word of a title starts with a capital letter and it's preceded by

a space and a comma, the word is moved to the head of the title. So it's possible to write titles like "Bay of Fundy, The", which sorts alphabetically in a more logical way.

To force the last word to its position (for example, "That's All, Folks"), write this line before the tune: %%titletrim 0.

4.1.8 Headers and Footers

The following commands define the text that is to appear automatically on every page: %%header for the page header, and %%footer for the page footer. These commands, followed by text, will print it by default centred on the page.

Three areas may be defined: left, centre, and right, each with different text. If you define areas, the line of text should be enclosed in double quotes. Furthermore, the text may use special symbols to insert specific information about the piece:

- \$d prints date and time of the last modification of the current input file;
- \$D prints the current date and time;
- \$F prints the name of the current file;
- \$I $\langle x \rangle$ prints the contents of a field ($\langle x \rangle$ is capital letter, from A to Z);
- \$P prints the page number;
- \$P0 and \$P1 print the page number, but only if it is even or odd;
- \$T prints the title of the current tune;
- \$V prints abcm2ps- followed by the version number;
- \n starts a second line of text.

The three fields must be separated by a *tab character* (see Section 1.2.2.) If you use JEDABC, I suggest that you use the lines <code>%%header</code> and <code>%%footer</code> obtained from the Mode/abcm2ps Options/page Layout menu, and if necessary, modify them.

Here is an example of the command %%footer used to print the even page numbers on the left, the name of the piece in the centre, and the odd page numbers on the right. Please note that the areas are *not* separated by spaces, but by tabs!

∠ Note

If you need to change headers and/or footers after a new page, insert their new definition *before* the %%newpage command.

4.2. FORMAT FILES 65

4.1.9 Inserting Graphics Files

Another interesting possibility is the addition of external EPS files in the source, perhaps to add a logo or a drawing to the score. You use the %%EPS command followed by the name of the file to insert:

```
X: 1
T: Testing the use of my logo
K: C
CDEF GABc |cBAG FEDC |
cdef gabc'|c'bag fedc|
%%multicol start
%%leftmargin 1cm
%%rightmargin 10cm
%%text
%%text Beautiful music presented by...
%%multicol new
%%leftmargin 7cm
%%rightmargin 1cm
%%EPS logo.eps
%%multicol end
```

Testing the use of my logo

abcm2ps will search for logo.eps in the directory containing the .abc sources or the format files (see below).

If the file to be included is in another standard graphics format (e.g. JPG), you will have to convert it to EPS using an appropriate program. Please consult Section 7.3.

4.2 Format files

Although you can insert formatting parameters in the source, it may be more practical to write them in an external file that is used by abcm2ps when it formats the piece. This file is called a *format file*.

This is a sample format file:

```
% format file scale 0.8
```

```
topmargin 2 cm
titlefont Helvetica-Bold 13
subtitlefont Helvetica-Bold 10
% etc. ..
% end
```

As you can see, this is nothing more than writing formatting parameters without the leading double percent characters %%.

To format a piece of music using the format contained in the file example.fmt, that you saved in the same folder as the source file, use the option -F of abcm2ps in the command line:

```
abcm2ps -O= -c -F example tune.abc
```

If you wish, you may specify two or more format files on the same command line.

If you keep your format files in a folder, i.e. c:\music\format, you will also have to specify the -D parameter followed by the folder name:

```
abcm2ps -O= -c -D c:\music\format -F example tune.abc
```

Binary packages for GNU/Linux usually store the format files in /usr/share/abcm2ps. The following command:

```
abcm2ps -V
```

will report the default format file directory.

Using a format file is the best solution when you want to typeset a series of pieces that share the same style. Moreover, abcm2ps can be extended defining additional symbols, as we will see in Section 4.5. Format files containing libraries of symbols can thus be employed when needed.

4.3 Numbering Measures and Pages

Usually, in a piece only the first measure of each line is numbered: this can be done with %measurenb 0. To number all measures, use %measurenb 1, while to put a number every $\langle n \rangle$ measures, you use $%measurenb \langle n \rangle$. Measures are numbered starting from 1, unless the first measure is incomplete (anacrusis); in this case, the anacrusis will count as measure 0.

Page numbering is controlled with the option $-\mathbb{N} \langle number \rangle$ from the abcm2ps command line. Possible values are:

- 0: page numbering deactivated.
- 1: page number above on the left.
- 2: page number on the right.
- 3: page number on the left for even pages, on the right for odd pages.
- 4: page number on the right for even pages, on the left for odd pages.

4.4. SAVING SPACE 67

4.3.1 Measure Control

The number of measures per line may be controlled in various ways:

- the most precise is to insert the exact number of measures in each line;
- in most cases, it is fine to just let abcm2ps do the work with the -c option (see Section 2.1);
- when you want each staff to contain $\langle n \rangle$ measures, use the command %%barsperstaff $\langle n \rangle$ in the source or the option -B $\langle n \rangle$ in the abcm2ps command line;
- %%alignbars $\langle int \rangle$ aligns the bars of the next $\langle int \rangle$ lines of music. It only works on single-voice tunes.

If the last line contains fewer measures that do not extend to the entire width of the page, you can force the alignment using the command %%stretchlast.

It is generally recommended not to be too concerned with the number of measures per line. You will be better off concentrating on the music and letting abcm2ps do the formatting with the -c option.

₩ Warning

If you decide to set the number of measures yourself, be careful not to write too many or too few per line! If you write too few, the score will look ugly; if you write too many, abcm2ps will rework the line at its discretion.

4.4 Saving Space

Quite often, one wants to print the score on the least possible number of pages. Once the page layout and the margins have been set, parameters that can reduce the space are:

- first of all, the powerful command %%scale \(\frac{factor}{\rho} \). By default, the score is produced with a scaling factor of 0.7. A greater value will enlarge the score, a smaller value will reduce its size.
- reduce the space between staves with %%staffsep and %%sysstaffsep, and use commands for setting the vertical spacing of title, subtitle, lyrics, etc.
- if the -c option is used, the %%maxshrink $\langle factor \rangle$ can be used to reduce the horizontal spacing between notes. Compression is maximum with $\langle factor \rangle = 1$, minimum with $\langle factor \rangle = 0$.
- to flatten slurs, use the %%slurheight command specifying values lesser than 1;
- sometimes, using %%notespacingfactor along with %%maxshrink might be effective. Normally, the spacing of notes is proportional to their length, but using %%notespacingfactor 1 all notes are equally spaced.
- in a file containing several tunes, use %%topspace 0.

Please remember to consider the needs of those who don't have an eagle-like sharp sight: printing a score at too small a scale will make life hard for the musicians! Further, bear in mind that inkjet printers cannot print beyond the the page lower margin of 2 cm.

4.5 Advanced Customisation (Experts Only!)

abcm2ps has a very powerful feature: the possibility to modify and/or add PostScript routines and new symbols. To do so, the user includes a series of commands that define the new symbol or routine in the source, using PostScript routines defined in abcm2ps or adding new ones.

It goes without saying that only musician-programmers will be able to use this feature. Furthermore, it is necessary to study the abcm2ps source code and look at the PostScript code it produces.

4.5.1 New PostScript and SVG Routines

The %%postscript command, followed by code in the PostScript language, adds new routines or redefines existing ones. For example, the following commands redefine the routine dlw so that all lines in the score will be drawn thinner:

```
%%postscript /dlw
%%postscript {0.3 setlinewidth} bdef % default: 0.7
```

so the score looks better at high values of %%scale.

The PostScript routines in abcm2ps are defined in the abcm2ps source file syms.c.

When writing several lines of PostScript code, using the sequence <code>%%beginps...</code> <code>%%endps</code> is recommended.

In addition to PostScript, commands in SVG can also be specified using %%beginsvg... %%endsvg.

4.5.2 Accompaniment Chords in Italian Notation

A nice application of %%postscript is the redefinition of the routine that prints accompaniment chords, in order to obtain them printed using Italian notes. The following code¹ should be saved in a format file called italian.fmt:

```
% italian.fmt
% written by Christopher Lane
% for abcm2ps 5.9.*
% (adapted for more abcm2ps versions by Hudson Lacerda)
% -- latin guitar chords
beginps nosvg
/gcshow % string gcshow
   -5 0 RM
```

¹kindly provided by Christopher Lane.

```
dup 0 get
 dup dup 65 ge exch 71 le and
  65 sub [(La) (Si) (Do) (Re) (Mi) (Fa) (Sol)] exch get show
   currentfont /Encoding get exch get glyphshow
 dup length 1 sub 1 exch getinterval
 dup mark exch (m) search
    (di) search cleartomark
     length exch pop exch (aj) anchorsearch cleartomark
       pop /tempstr 4 2 roll cleartomark
       def tempstr exch (-) putinterval tempstr
      ifelse
     ifelse
 cleartomark ifelse
 currentdict /qchshow known
   /gchshow load cshow %% abcm2ps older than abcm2ps-5.1.0
                         %% abcm2ps-5.1.0 or newer
   show
  ifelse
!
endps
% End of file italian.fmt
```

If we add -F italian to the command line, the usual scale will be printed with Italian accompaniment chords:

```
X: 1
L: 1/4
K: C
"C"CDEF|"G"GABc|"A-"A,B,CD|"E-"EFGA|
```

4.5.3 Defining New Symbols

The %%deco command adds new expression symbols, using PostScript routines defined by abcm2ps or possibly new ones written by the user. The syntax is the following:

```
%%deco \langle name \rangle \langle type \rangle \langle ps \rangle \langle h \rangle \langle wl \rangle \langle wr \rangle \langle string \rangle
```

where:

• *(name)* is the name of the new symbol, without the exclamation marks;

• $\langle type \rangle$ is an integer that specifies the symbol type. Values from 0 to 2 indicate a symbol near the note and within the staff, from 3 to 5 near the note but outside of the staff, and 6 and 7 are expressions linked to the staff. To give an idea of symbol positioning, here is a listing:

```
0: like !tenuto! or the staccato dot;
1: like !slide!;
2: like !arpeggio!;
3, 4: generic expressions;
5: like !trill(! or !trill)!;
6: generic;
7: like long dynamics symbols.
```

- \(\langle ps\rangle\) is the name of the PostScript routine that draws the symbol. This may be a user-defined routine or one provided by abcm2ps;
- $\langle h \rangle$ expression height in points;
- $\langle wl \rangle$ and $\langle wr \rangle$ are not used;
- finally, $\langle string \rangle$ is an optional text string.

Let us have a look at an example taken from the file deco.abc supplied with abcm2ps. We will add a few new symbols for dynamics using the predefined pf routines:

```
%%deco fp 6 pf 20 0 0 fp
%%deco (f) 6 pf 20 0 0 (f)
%%deco (ff) 6 pf 20 0 0 (ff)

X: 1

T: New symbols

K: C
!fp!CDEF GABc|CDEF !(f)!GABc|!(ff)!CDEF !ff!GABc|
```

New symbols

The %%deco line implements three new symbols: !fp!, !(f)!, and!(ff)!.

Let us see another example. The following source adds three new symbols: one note-linked and two staff-linked, one above the staff and one below. The first symbol !tu! is a triangle-shaped staccato symbol. !tu! uses the new routine newdot. The other symbols are !rtoe! and !ltoe! which use the routine toe and add a symbol similar to a above and below the staff.

```
%%postscript /newdot % usage: x y newdot
%%postscript M 1.2 2.5 rmoveto -2.4 0 rlineto
%%postscript
              1.2 -5 rlineto fill bdef
%%deco tu 0 newdot 5 0 0
%%postscript /toe
                   % usage: x y toe
%%postscript
               M 5 0 rmoveto
               -5 5 rlineto -5 -5 rlineto currentpoint stroke
%%postscript
%%postscript bdef
%%deco rtoe 6 toe 5 0 0
%%deco ltoe 3 toe 5 0 0
X: 1
K: C
!tu!C!tu!D!tu!E!tu!F GABc|!ltoe!c'!rtoe!bag .f.e.d.c|!ltoe!C4 z4|]
```

4.5.4 Adding Fonts

Standard Ghostscript fonts are usually enough for most users. However, if you wish to add a special touch to your scores, new fonts can be added. Recent versions of Ghostscript support both PostScript and TrueType fonts. For more details, please see Appendix A.5.3.

An excellent site boasting a wide collection of free and high-quality PostScript fonts is http://www.moorstation.org/typoasis/typoasis1.htm. Under the "Designers" section, select Dieter Steffmann's page.

Let us see how to add a new font called Holla Script, downloaded as Holla.zip. Obviously, the procedure will be very similar with other fonts.

Unzip the archive and copy <code>HollaScript.pfb</code> to the directory containing the Ghostscript fonts. (Other acceptable file types are those ending in <code>.gsf</code> and <code>.pfa.</code>) Supposing that you installed Ghostscript and its fonts in default locations, this directory is <code>C:\ProgramFiles\gs\gs8.71\lib</code> on Windows systems. (If needed, change the version number). On Ubuntu GNU/Linux and possibly other Unix variants, the directory is <code>/usr/share/fonts/type1/gsfonts/</code>. If you're unsure, open a terminal window and type the following command:

```
$ qs -h
```

to get a list of directories where Ghostscript searches for fonts.

Now edit Ghostscript's font list. On Windows, this file is C:\ProgramFiles\gs\gs8.71\lib\Fontmap (create it if it doesn't exist), on Ubuntu it is /var/lib/ghostscript/fonts/Fontmap. Move to the bottom of the file and add this line:

```
/HollaScript (/usr/share/fonts/type1/gsfonts/HollaScript.pfb) ;
```

which defines a new font called HollaScript. If you wish, you can also define an *alias*, i.e. an alternate name for the same font:

```
/Jazz /HollaScript ;
```

We are now ready to use the new font in ABC files. First of all, declare it using the %%font command followed by the font name. Look at this:

```
%%font HollaScript
%%titlefont HollaScript 24
%%textfont HollaScript 18
%%composerfont Jazz 16 % alias
%%vocalfont Jazz 16
%%gchordfont Jazz 18
X: 1
T: Test: HollaScript font (Jazz)
L: 1/4
K: C
%
"C"CDEF|"G"GA"G7"Bc|"C"cBAG|"G"FEDC|"C"C4|]
W: Do Re Mi Fa... |||||
%%text ABCDEFGHIJKLMNOPQRSTUVWXYZ
%%text abcdefghijklmnopqrstuvwxyz 1234567890
```

Test: HollaScript font (Jazz)

ABCDEFGHIJKLMNOPQRSTUVWXYZ

abcdefghijklmnopqrstuvwxyz 1234567890

Bear in mind that some fonts you can find on the Internet are not complete (they may only have capital letters, or miss some characters); not all are free; and not all are of good quality.

4.5.5 Customising Tuplets

The %%tuplets command allows for fine-grained tuplet indications. The syntax is:

```
%%tuplets \langle where \rangle \langle what \rangle \langle value \rangle
```

The parameters are:

• where is a number that indicates where to draw the tuplet indication. 0 = automatic, 1 = never, 2 = always.

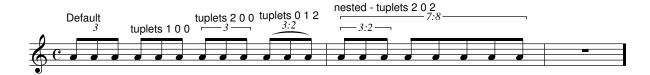

4.6. TABLATURES 73

- what is a number that indicates what to draw. 0 = draw a bracket, 1 = draw a slur.
- value indicates the number to print. 0 =the value of $\langle n \rangle$ in the tuplet, 1 =no value at all, 2 =a ratio $\langle n \rangle : \langle t \rangle$.

Common values are, for instance, I:tuplets 2 0 2 and I:tuplets 2 0 0:

```
X: 1
T: Tuplets
M: C
L: 1/4
K: none
%
"^Default"(3A/A/A/ "^tuplets 1 0 0"[I:tuplets 1 0 0](3A/A/A/ \
"^tuplets 2 0 0"[I:tuplets 2 0 0](3A/A/A/ \
"^tuplets 0 1 2"[I:tuplets 0 1 2](3A/A/A/| \
"^nested - tuplets 2 0 2"[I:tuplets 2 0 2](7:8:8(3A/A/A/ A/A/A/A/A/24]
```

Tuplets

4.6 Tablatures

A *tablature* is a simplified notation format that indicates instrument fingerings instead of notes. It's meant to be easier than standard notation, and it's usually employed by folk musicians and in introductory music courses for children.

abcm2ps supports native "tablatures" (fingering charts, actually) for the tin whistle, and provides support for user-defined tablatures. The latter are quite complex to implement, and will be covered in future release of this manual.

4.6.1 Tin Whistle Fingerings

True to the folk music origins of ABC, abcm2ps can print tin whistle fingerings. For those who don't know, the tin whistle is a six-holed diatonic fipple flute, widely employed in Irish, English and other traditional music.

It is cheap, easy to learn (easier than the recorder), and very fun to play. I warmly suggest that you buy one!

The format file flute.fmt contains fingerings definitions for tin whistles in several keys; for the *galoubet*, a French three-hole fipple flute, and other three-hole instruments (English pipe (and tabor) and Basque txistu).

Specify the following parameters on the abcm2ps command line:

```
-F flute.fmt -T \langle key \rangle
```

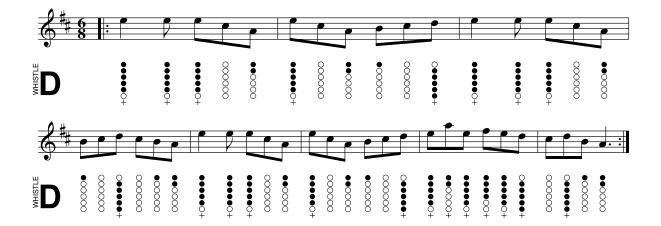

to obtain fingerings for the whistle in the key of $\langle key \rangle$ printed under the staff. The parameter $\langle key \rangle$ is a digit corresponding to a key as per the following table:

Digit	Key
1	D
2	C
3	$\mathbf{E}\flat$
4	$\mathbf{B}\flat$
5	F
6	G
7	A
8	C (galoubet)

Here is an example. The whistle in the key of D is the most commonly used; we'll specify the parameters -F flute.fmt -T1. An excerpt from "Atholl Highlanders":

```
X: 1
T: The Atholl Highlanders
M: 6/8
L: 1/8
R: jig
K: AMix
%
|:e2e ecA|ecA Bcd|e2e ecA|Bcd cBA|
e2e ecA|ecA Bcd|eae fed|cdB A3:|
```

The Atholl Highlanders

Chapter 5

Playing

5.1 MIDI Conversion

A MIDI file is, roughly speaking, an electronic score. It contains instructions that tell MIDI instruments (or a software MIDI player) what notes to play and how to play them. It is not as high-level as sheet music; electronic instruments and computers need to be told exactly what and how to play. Please note that real scores carry a bit of ambiguity. For instance, just how long a fermata is? MIDI files are not as sophisticated as a human player. Moreover:

Very important!

while a score in PDF format will look the same on any computer, this does not hold true for MIDI files! In fact, the quality of a MIDI file output depends on the sound card of the computer and the player software that is used to listen to it.

Having a MIDI version of your ABC music is convenient, because you get an immediate feedback of what you wrote. It's especially true for people who can't easily read music.

To this end, the free abc2midi program is helpful. Given a tune collection in a file called file.abc, abc2midi creates a MIDI file for each tune adding the index number of the X: field to each file name: file1.mid, file2.mid, ... abc2midi is a command-line program, but it's integrated in ABCexplorer and JEDABC.

abc2midi supports up to 16 voices ("channels", in MIDI lingo) that can play at the same time, as defined by the MIDI standard. Each channel can be associated one of the standard 128 MIDI instruments ("programs"), and their loudness ("velocity") can be controlled independently. Don't ask me about the strange terminology.

abc2midi is just one of the programs of the abcMIDI package:

- abc2abc: verification, formatting and transposition of ABC source files;
- midi2abc: conversion of MIDI files to ABC;
- yaps: a command-line formatter analogous to abcm2ps, but less powerful.

Before we start, some information for GNU/Linux users is needed.

5.1.1 A Software MIDI Player: TiMidity++

Some advanced sound cards have a built-in MIDI syntesizer, but cheap cards usually do not provide this feature. In this case, some GNU/Linux users may need a software MIDI player. One of the best is Timidity++ (http://timidity.sourceforge.net/), usually provided by major GNU/Linux distributions.

Unfortunatley, there's a catch. By default, TiMidity++ may not provide all 128 MIDI instruments, which are mapped to so-called *instrument patches*. Simply put, these are files that provide sounds. Some patches may be missing, which results in MIDI files that apparently do not play or miss some voices.

Replacing the missing instruments is easy. By default, the configuration files are:

```
/etc/timidity/timidity.cfg
/etc/timidity/freepats.cfg
```

The first file should contain a couple of lines that read:

```
# By default, try to use the instrument patches from freepats:
source /etc/timidity/freepats.cfg
```

To replace a missing instrument, edit the second file. Let's suppose you miss the instrument 41 (Viola) under the bank 0 section. Add this line:

```
41 Tone 000/040 Violin.pat
```

which implements the Viola instrument using the same patch used for violin. Not perfect, but it works

An alternate way to provide more instrument patches to TiMidity++ is by installing the package FluidSynth, http://www.fluidsynth.org, as I did on my Ubuntu machine.

5.1.2 Our First Midi

Do you remember the first scale and the command-line instructions we examined in Section 1.2.3? We wrote a very simple ABC source and turned it into PostScript using abcm2ps from the command line.

In a similar way, we can obtain our first MIDI file. Given the source file scale1.abc (or another source you want to convert), this command will create the corresponding MIDI file:

```
abc2midi scale1.abc
Warning in line 2 : No M: in header, using default
writing MIDI file scale11.mid
```

The new file scale11.mid will be written in the same folder as the source. Warning and/or error messages will be issued when minor and/or serious problems are found.

By default, the MIDI file name is composed using the source file name followed by a number, corresponding to the number in the K: field. Double-click on the MIDI file to start the default player.

5.1.3 Example: How To Make a Ringtone

MIDI files are not very impressive to listen to, but they can be very useful. For example, I made my own simple ringtone following a few simple steps; I used TiMidity++ to convert the MIDI file to WAV, then Lame (http://lame.sourceforge.net/) to encode the WAV file to MP3. First, I wrote the ringtone (Ring.abc):

```
X:1
M:2/4
L:1/32
Q:1/4=240
K:Amaj
%%MIDI program 1 80
|:ac'ac'ac'ac'ac'ac'ac'ac'ac'ac'ac'ac'ac'|[L:1/2]z:|
```

then I ran abc2midi and obtained Ring1.mid. To convert the MIDI file to MP3, I used the following commands (boldface):

```
~$ timidity -A400 -Ow Ring1.mid
Playing Ring1.mid
MIDI file: Ring1.mid
Format: 0 Tracks: 1 Divisions: 480
Sequence: Trillo
Text:
Output Ring1.wav
Playing time: ~7 seconds
Notes cut: 0
Notes lost totally: 0
"$ lame Ring1.wav Ring1.mp3
LAME 3.98.4 32bits (http://www.mp3dev.org/)
CPU features: MMX (ASM used), SSE (ASM used), SSE2
Using polyphase lowpass filter, transition band: 16538 Hz - 17071 Hz
Encoding Ringl.wav to Ringl.mp3
Encoding as 44.1 kHz j-stereo MPEG-1 Layer III (11x) 128 kbps qval=3
   Frame | CPU time/estim | REAL time/estim | play/CPU |
                                                           ETA
  206/206 (100%) | 0:00/ 0:00| 0:00/ 0:00| 24.460x|
                                                            0:00
_____
           LR MS % long switch short %
 128.0 53.9 46.1
                         98.5 1.0 0.5
Writing LAME Tag...done
ReplayGain: -2.4dB
~$_
```

Then I transfered Ring1.mp3 to my smartphone.

∠ Note

In the following sections, I will include some sound samples. In theory, MIDI files created by abc2midi should be playable on all computers, but unless you have the same instrument patches that I use (or compatible ones) there is a chance that you can't listen to them. Therefore, all MIDI files were converted to MP3 files with Lame, as shown above.

5.1.4 Supported Ornaments

Some of the ornaments described in Section 2.2.8 are supported by abcMIDI and produce audible output. These are:

```
!ppp! !pp! !p! !mp! !mf! !f! !ff! !fff! !breath!
!arpeggio! !crescendo(! !crescendo)! !<(! !<)!
!diminuendo(! !diminuendo)! !>(! !>)!
```

Default volume is equivalent to !f!.

5.1.5 %%MIDI Commands

Just as abcm2ps provides commands for changing page layout details, abc2midi provides commands for audio effects.

abc2midi uses meta-comments for its low-level details. To be more precise, only the meta-comment %%MIDI, followed by different parameters, is actually used.

Commands can be written in two ways. One is the usual meta-comment syntax: a single line containing %%MIDI $\langle command \rangle \langle parameters \rangle$ is entered. The second way is using an inline I field: [I:MIDI = $\langle command \rangle \langle parameters \rangle$] (spaces are optional). Note the = character.

To clarify, the two following sources are equivalent:

```
X: 1
T: MIDI commands as meta-comments
L: 1/4
K: C
%%MIDI program 1
CDEF|
%%MIDI program 109
GABc|
```

```
X: 1
T: MIDI commands as inline I: fields
L: 1/4
K: C
[I:MIDI = program 1] CDEF|[I:MIDI = program 109] GABc|
```

The second method makes the source more readable.

5.1.6 Voices and Instruments

Let us consider "Ave Verum", which we examined in Section 3.1.2. Converting it with abc-2midi, we obtain a MIDI file in which the music output is played by the MIDI instrument 1: acoustic piano. In many cases, we don't need anything else: to study the part before a concert, the MIDI is just fine. But abc2midi can do much more.

One of the most important abc2midi commands is %%MIDI program, which associates a voice with a particular instrument. Let us add these commands to associate each voice with the right instrument in the Ave Verum:

```
X: 1
T: Ave Verum
C: W. A. Mozart
M: 4/4
L: 1/4
Q: "Adagio"
%%staves [(S A) (T B)] (MD1 MD2) | (MS1 MS2)
V: S clef=treble name="Soprano" sname="S"
V: A clef=treble name="Alto" sname="A"
V: T clef=bass name="Tenor" sname="T"
V: B clef=bass name="Bass" sname="B"
V: MD1 clef=treble name="Organ"
V: MD2 clef=treble
V: MS1 clef=bass
V: MS2 clef=bass
K: D
V: S % enable the first track
%%MIDI program 1 53 % Choir Oohs
%%MIDI program 2 53
%%MIDI program 3 53
%%MIDI program 4 53
%%MIDI program 5 19 % Church Organ
%%MIDI program 6 19
%%MIDI program 7 19
%%MIDI program 8 19
... body of transcription ...
```

The eight voices S A T B MD1 MD2 MS1 MS2 are automatically assigned by abc2midi the numbers 1 to 8. Then the %%MIDI program commands follow that associate each voice with an appropriate MIDI instrument, MIDI 54 ("Choir Oohs") or 20 ("Church Organ").

Note the V: S line before the %%MIDI program lines. It should not be necessary, but it's needed as a workaround for a bug in current abc2midi. Basically, it forces the instrument changes to occur in the first MIDI track.

Another way to assign an instrument to a voice is the following:

```
%%MIDI channel 1 % selects melody channel 1 (range: 1-16)
```

```
%%MIDI program 53 % assigns 53 to current channel
```

The numbers that identify each instrument are listed in Appendix A.8. Note that the numbers in the list range from 1 to 128, whereas abc2midi numbers them 0 to 127. If no MIDI program is specified, voices will be assigned by default the General MIDI instrument 1.

5.1.7 Accompaniment Chords

The accompaniment chords described in Section 2.2.6 are used by abc2midi to generate an accompaniment to the main melody. A lower case letter a...g can be used as note name; abc2midi will play the fundamental note instead of the chord.

If the optional note is present, as in C/B or C/E, two cases are possible. If the note does not belong to the chord as in the first example, it will be added below the fundamental note of the chord. If it does belong as in the second example, *chord inversion* will be applied and the note will become the lowest in the chord.

The types of chords currently recognised are:

```
m 7 m7 maj7 M7 6 m6 aug + aug7 dim dim7 9 m9 maj9 M9 11 dim9 sus sus9 7 \sin 4 7 \cos 9
```

Additional chords can be defined with %%MIDI chordname, explained in Section 5.1.10.

Accompaniment chords are rendered by abc2midi as a sequence of fbcz for each measure. f stands for the fundamental or root of the chord, b for the fundamental and the chord played together, c for the chord itself, and z for a rest. A fbcz sequence is designed to match a time signature: for example, in 4/4 time the accompaniment is fzczfzcz: fundamental, rest, chord, rest, fundamental, rest, chord, rest.

abc2midi associates specific fbcz sequences to the more common time signatures: fzczcz for 3/4 time, fzcfzc for 6/8, fzcfzcfzc for 9/8, and fzcfzcfzcfzc for 12/8.

In practice, the following piece:

```
X: 1
M: 4/4
L: 1/4
K: C
%
"C"CDEF|"G"GABc|"C"C2"G"E2|"C"Czz2|
```

will sound as if it were written like this:

Beware: the fbcz sequence does not correspond to the beats in a measure, and the length of the elements does not depend on the value of the L: field. Sequences are adapted to match one measure; thus, fcz, d2c2z2 and f4c4z4 have equivalent meaning.

If you don't hear accompaniment chords, your tune might have a time signature for which a predefined fcz sequence is missing: for example, 3/8, 5/4 or 7/8. The sequence can be easily added, though. For example, a sequence for 7/8 is fzbczcz.

The fcz sequence can be modified when desired with the %%MIDI gchord command. Here is the above tune with a simpler accompaniment:

```
X: 1
M: 4/4
L: 1/4
K: C
%%MIDI gchord c4c4
%
"C"CDEF|"G"GABc|"C"C2"G"E2|"C"Czz2|
```

Here we changed the sequence to c4c4 to obtain two chords in every measure.

To modify the instrument associated with the chord, the <code>%%MIDI</code> chordprog command is used; for the fundamental, <code>%%MIDI</code> bassprog. To specify the volume, use <code>%%MIDI</code> chordvol for the chord and <code>%%MIDI</code> bassvol for the fundamental (from 0 to 127). Finally, to disable temporarily accompaniment chords use <code>%%MIDI</code> gchordoff, and <code>%%MIDI</code> gchordon to turn chords back on.

Note that chords will continue to be played even when the melody stops. The following tune has no melody, but only accompaniment chords:

```
X: 1
T: La Folia
M: 3/4
L: 1/4
Q: 1/4=80
K: Dm
%%MIDI gchord c2c2zc
%%MIDI chordprog 24 % guitar
"Dm"z3|"A"z3|"Dm"z3|"C"z3|"F"z3|"C"z3|"Dm"z3|\
%%MIDI gchord c3
"A"z3|
%%MIDI gchord czc
"Dm"z3|"A"z3|"Dm"z3|"C"z3|"F"z3|"C"z3|"A"z3|\
%%MIDI gchord czc
"Dm"z3|"A"z3|"Dm"z3|"C"z3|"F"z3|"C"z3|"A"z3|\
%%MIDI gchord c3
```

Listen to the accompanying file folia.mp3.

Let us now look at a piece that has 4/4 time but a very different rhythm: "The Girl from Ipanema", a famous Brazilian song written by Antônio Carlos Jobim:

```
X: 1
T: Garôta De Ipanema
T: (The Girl From Ipanema)
C: Antônio Carlos Jobim
M: 4/4
L: 1/8
K: F
P:A
|:"Fmaj7" !p!G2 GE E2 ED|G2 GE EE DG-|"G7"G2 GE EE DG-|
G2 GE EE DF-|"Gm7"F2 FD DD CE-|"Gb7"E2 EC CC B,C-|
[1"Fmaj7"C8|"Gb7"z8 :|[2"Fmaj7"C8 |z8||
P:B
"Gb7"F8-|(3F2_G2F2 (3:2:3_E2F2E2|"B7"_D3 _E-E4-|_E6 z ^G-|
"F#m7"^G8-|(3^G2A2G2 (3^F2G2F2|"D7"E3 ^F-F4-|^F6 z A-|
"Gm7"A8-|(3A2B2A2 (3:2:3G2A2G2|"Eb7"F3 G-G4-|G4 (3z2A2B2|
"Am7"(3c2C2D2 (3E2F2G2|"D7"^G3 A3 z2|"Gm7" (3B2B,2C2
(3D2E2F2|"C7" ^F3 G3 z2 ||
P:C
"Fmaj7"G3 E EE DG-|G2 GE- EE DG-|"G7"G2 GE EE DG-|G2 GE EE DA-|
"Gm7"A2 AF FF Dc-| "Gb7" c2 cE (3E2E2D2| "Fmaj7" E8-| E2 z6|
P:D
z811
```

When converted to MIDI, it sounds pathetic... a bossa nova has a completely different rhythm. We need to specify another fcz sequence that corresponds to a bossa nova. Let us insert these lines after the P:A field:

and this one immediately following the P:D field:

```
%%MIDI gchord c2
```

Reconverting to MIDI we now have a bossa nova worth its salt: garota.mp3.

5.1.8 Customising Beats

MIDI files usually sound artificial and expressionless, but there are several ways to improve them. The command %MIDI beatstring $\langle fmp \rangle$ provides a way of specifying where the strong, medium and weak stresses are placed within a bar.

f indicates a strong beat, m a medium beat, and p a soft beat. For example, let's consider an Irish jig, which has a 6/8 time. The corresponding fmp sequence would be fppmpp.

To fine-grain the volume of the single notes in a measure, the %%MIDI beat $\langle vol12 \rangle$ $\langle vol2 \rangle$ $\langle vol3 \rangle$ $\langle pos \rangle$ command can be used. vol1, vol2, and vol3 specify the volume of notes that fall on a strong, medium, and weak beat, while pos indicates the position of strong beats in the measure. abc2midi provides default values for all volume specifiers such as !p! or !ff!.

The following example is an Irish jig:

```
X:1
T: The Swallowtail Jig
R:Jiq
M:6/8
L:1/8
Q:180
K:D
%%MIDI program 1 22
E/F/I
% flattish
%%MIDI beat 105 95 80 1
"Em"GEE BEE |GEG BAG |"D"FDD ADD |dcd "Bm"AGF|
"Em"GEE BEE |GEG B2c | "D"dcd "Bm"AGF | "Em"GEE E2 E/F/|
% more swing
%%MIDI beat 105 90 60 3
"Em"GEE BEE |GEG BAG |"D"FDD ADD |dcd "Bm"AGF|
"Em"GEE BEE |GEG B2c | "D"dcd "Bm"AGF | "Em"GEE E2 B |
%%MIDI beat 105 95 80 1
"Em"Bcd e2 f|e2 f edB|Bcd e2 f |edB "D"d2 c|
"Em"Bcd e2 f|e2 f edB|"D"dcd "Bm"AGF|"Em"GEE E2B|
%%MIDI beat 105 90 60 3
"Em"Bcd e2 f|e2 f edB|Bcd e2 f |edB "D"d2 c|
"Em"Bcd e2 f|e2 f edB|"D"dcd "Bm"AGF|"Em"GEE E2z|]
```

that converts into this MIDI file: swallowtail.mp3. Note how the different parts have less or more swing.

To remove temporarily the emphasis programmed with <code>%%MIDI</code> beat, use the command <code>%%MIDI</code> nobeataccents. To resume it, use <code>%%MIDI</code> beataccents.

5.1.9 Arpeggios

In addition to fcz sequences, you can also specify ghijz sequences that allow you to play the individual notes comprising the guitar chord. This allows you to play broken chords or arpeggios.

The new codes ghijGHIJ reference the individual notes, starting from the lowest note of the chord. For example, for the C major chord, g refers to C, h refers to E and i refers to G. Upper case letters refer to the same notes one octave lower, z to a rest.

The following example plays the C major chord as an arpeggio of CEGE:

```
%%MIDI gchord ghih
```

Furthermore, you can use fcz and ghij sequences together, like fcbghijGHIJz.

Another way to play chords as arpeggios is the %MIDI chordattack command. When followed by a number $\langle n \rangle$ greater than 0, it delays each note by $\langle n \rangle$ MIDI time units (a quarter note is 480 MIDI units). Using %MIDI randomchordattack $\langle n \rangle$ varies the delay of each note randomly between 0 and $\langle n \rangle$.

5.1.10 New Accompaniment Chords

The %%MIDI chordname command allows you to change the notes of an accompaniment chord, or define new chords. The syntax is:

```
%%MIDI chordname \langle chord\ name \rangle\ \langle n1 \rangle\ \langle n2 \rangle\ \langle n3 \rangle\ \langle n4 \rangle\ \langle n5 \rangle\ \langle n6 \rangle
```

where "chord name" is a name such as those given in Section 5.1.7, $\langle nI \rangle$ is the chord fundamental and and the other notes (up to 6) are expressed as semitones above the fundamental.

These lines define the chords "4" and "5+":

```
%%MIDI chordname 4 0 5 7 12 % e.g. C F G c %%MIDI chordname 5+ 0 4 8 12 % e.g. C E ^\circG c
```

Now we can apply these new chords to any note: "C4", "G5+" and so forth.

5.1.11 Broken Rhythm

A typical rhythm of traditional Irish music is the *hornpipe*, which consists of series of dotted notes (broken rhythm):

```
X: 1
T: Broken rhythm
M: 2/4
L: 1/8
K: C
C>D E>F | G>A B>c | c>d e>f | g>a b>c' |
c'>b a>g | f>e d>c | c>B A>G | F>E D>C |
```

Writing a piece this way can be tedious. There is a shortcut though: adding the R:hornpipe field will instruct abc2midi to set the broken rhythm automatically. This effect will only work if the note length is set to 1/8.

Let us rewrite the scale:

```
X: 1
T: Broken rhythm
R: hornpipe
M: 2/4
```

```
L: 1/8

K: C

CD EF | GA Bc | cd ef | ga bc' |

c'b ag | fe dc | cB AG | FE DC |
```

This is the resulting MIDI file is: broken.mp3.

Note

Note that abc2midi plays the notes in a different way than they are notated. For instance, A>B should be played as A3/2 B/2 but is actually played as A4/3 B2/3. That is, instead of a ratio 3:1 abc2midi employs a ratio 2:1. The rationale (pun unintended) is that 2:1 is the way hornpipes are approximately played.

This behaviour can be reversed to normal with the %%MIDI ratio 3 1.

5.1.12 Drum Patterns

In addition to accompaniment chords, we can add a percussion accompaniment to our music with %%MIDI drum command, which has a syntax somewhat similar to %%MIDI gchord.

The %%MIDI drum command is followed by a sequence of dz, where d represents a percussion beat and z, predictably, a rest. After the sequence, you write the codes for the desired percussion instruments (see Appendix A.8.2) and their volumes expressed as numbers from 0 to 127.

A drum accompaniment is turned on with <code>%%MIDI</code> drumon and turned off with <code>%%MIDI</code> drumoff. The following tune has a bass drum and hi-hat accompaniment:

You cannot specify a fractional length: to indicate a rhythm such as (3ddd d/d/d/ you need to use the sequence d4d4d4d3d3d3d3.

Here is a fun and more complex example (riff.mp3):

```
X: 1
M: 4/4
T: Riff
%%MIDI program 1 25 % Steel String Guitar
```

```
Q: 1/4=160
K: C
%%MIDI drum dzddd2dz 35 39 39 35 39 127 80 80 127 80
% Bass Drum 1 + Electric Snare
%%MIDI gchord ccccccc
%%MIDI drumon
"C"CC EE GG AA| BB AA GG EE|
CC EE GG AA| BB AA GG EE|
"F"FF AA cc dd|"F7"_ee dd cc AA|
"C"CC EE GG AA|_BB AA GG EE|
%%MIDI gchordoff % no chords
"G"GG BB dd Bd|"F7"FF AA cc Ac|
%%MIDI gchordon % turn chords back on
"C"CC EE GG AA|_BB AA GG EE|
%%MIDI gchord c8
%%MIDI program 1 60 % Brass Section
%%MIDI drumoff
!fermata!"C"[C8E8G8c8]|
```

5.1.13 Percussion Instruments

MIDI files have different *channels*, which can hold several *tracks*. Normally, you don't bother with these details; all you need to know is that, by default, different voices correspond to different tracks on the same channel.

In normal MIDI channels, all notes belong to the associated instrument. However, the special MIDI channel 10 has a peculiar feature: each note is associated with a different percussion instrument. Considering the instrument list in Appendix A.8.2, the following tune will have a melody played by piano, and low-tom, hi-hat and triangle accompaniment (accomp.mp3):

```
X: 1
L: 1/4
0: 1/4 = 120
V: 1 name="Piano"
V: 2 clef=perc name="Low Tom"
V: 3 clef=perc name="Open Hi Hat"
V: 4 clef=perc name="Open Triangle"
K: C
[V: 1] CDEF
                                 | % Piano
                |GABc
[V: 2] %%MIDI channel 10
A,, zA,, z
                |A,,zA,,z|
                          | % Low Tom
[V: 3] %%MIDI channel 10
z^A,,z^A,,
                |z^A,,z^A,,
                            | % Open Hi Hat
[V: 4] %%MIDI channel 10
```

Note that the %%MIDI channel 10 command must be written after the V: field that starts a new voice.

Unfortunately, if we typeset this piece we will not get what we would expect: Low Tom and Open Hi-Hat will be rendered as very low notes. In fact, abcm2ps has limited support for percussions. Future releases may provide full support for percussions instruments.

5.1.14 Portamento

A glide effect can be added using the %%MIDI portamento [bass] [chord] $\langle n \rangle$ command, where $\langle n \rangle$ is a number between 0 (no effect) and 63 (maximum effect).

The following is the riff from Impressioni di Settembre, a great song by Italian progressive rock band Premiata Forneria Marconi. The first repeat has no glide effect, while the second repeat mimics the original Moog glide (impressioni.mp3):

```
X: 1
T: Impressioni di Settembre (riff)
C: Premiata Forneria Marconi, 1972
M: 4/4
L: 1/8
Q: 1/4=140
K: Dm octave=-1
%%MIDI program 1 81
%%MIDI chordprog 80
%%MIDI gchord b4
%%MIDI chordvol 50
%%MIDI portamento 0
|:"Dm"D4-DE F2|G A2 c d2 f e-|"C"e d c2 q4-|gfed- dcg2|
"G"f e2 d2 c =B2-|=B A G3 BG A-|"Dm"A d- d6-|d8
%%MIDI portamento 60
: |
D8-|D8|1
```

%%MIDI noportamento turns off the effect.

5.1.15 Drone

Bagpipe, medieval and other kinds of music are often accompanied by one or more drone notes. abc2midi supports drones using these commands:

- %%MIDI drone \(\langle instrument\rangle \(\rangle pitch1\rangle \rangle pitch2\rangle \(\langle vel1\rangle \rangle vel2\rangle \) specifies the drone characteristics;
- %%MIDI droneon starts the drone accompaniment;
- %%MIDI droneff stops the drone.

The parameters of the %%MIDI drone command are $\langle instrument \rangle$, that specifies the MIDI instrument for the drone; $\langle pitch1 \rangle$ and $\langle pitch2 \rangle$ are the MIDI pitches of the drone notes; $\langle vel1 \rangle$ and $\langle vel2 \rangle$ are the MIDI "velocities", that is the volume, of the drone notes.

The pitches are not specified as ABC notes, but as standard MIDI pitches. In short, these are numeric codes (1–127) that correspond to notes, as shown in Table 5.1. To obtain notes higher or lower than the octave shown in the table, simply add or subtract 12 to the note.

The default values of %%MIDI drone are 71 (bassoon), 45 (A,,), 33 (A,,,), 80 and 80.

Note	Α,,	^A,,	В,,	C,	^C,	D,	^D,	E,	F,	^F,	G	^G,	A,
MIDI pitch	45	46	47	48	49	50	51	52	53	54	55	56	57

Table 5.1: Standard notes and corresponding MIDI pitches.

Let's put it into practice. This is Amazing Grace, written in G major with bagpipe drone accompaniment:

```
X:1
T:Amazing Grace
M:3/4
L:1/8
Q:40
K:G
%%MIDI gracedivider 16
%%MIDI program 109
%%MIDI drone 109 43 31 70 70
%%MIDI droneon
|z3 z2D|/AG2 B/G/ B2 A|/AG2 FE D2 D|
/AG2 /CB/G/ /CB2 A/B/|d3-d2 B|
d2 B/G/ B2 A|G2 E /ED2 D|
/AG2 B/G/ B2 A|/AG3-G2 |]
%%MIDI droneoff
```

The resulting MIDI file is amazinggrace.mp3.

5.1.16 midi2abc

This program converts a MIDI file to the corresponding ABC source. It does the job with good approximation, but the source should be edited to add voice layout and formatting parameters. The command line is simply:

```
midi2abc file.mid -o file.abc
```

midi2abc has many command-line parameters, which we will not examine for now. By default, the resulting ABC file will contain only one measure per line.

The best way to get an ABC source from a MIDI file is using runabc.tcl as shown in Figure 5.1. Select extras/midi2abc, then fill the appropriate fields. The voice interleave radio button will write different voices interleaved, instead of one after another.

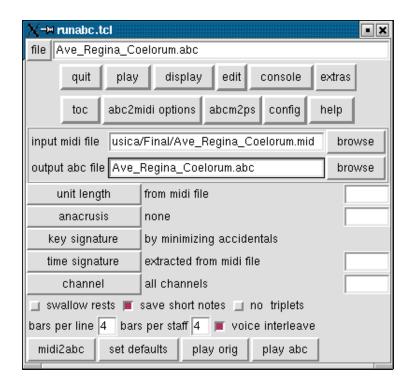

Figure 5.1: Converting a MIDI file to ABC with runabc.tcl.

Press the button midi2abc to create the ABC source.

Don't expect to obtain perfect sources all the time! In fact, while sheet music (be it written in ABC or in any other format) can always be translated into MIDI, the opposite does not always hold true. Remember what I explained in Section 5.1. For example, you will see that trills are translated as sequences of short notes; repeats will just duplicate measures; and many other problems. Sometimes, note length will look crazy.

Bearing in mind that some of these limitations cannot be avoided, further development is being planned to improve the output of midi2abc.

5.1.17 Global Settings

In a tune collection (i.e. a file containing several tunes), the same MIDI settings could be shared by all or most tunes. Instead on inserting the same %%MIDI lines in each tune, it's possible to place them at the beginning of the file; the parameters will apply to all tunes.

These parameters can be

- %%MIDI C
- %%MIDI nobarlines
- %%MIDI barlines
- %%MIDI fermatafixed
- %%MIDI fermataproportional
- %%MIDI ratio

- %%MIDI chordname
- %%MIDI deltaloudness

Obviously, these parameters may be overridden by %%MIDI lines within each tune.

5.2 Differences and Incompatibilities

Unfortunately, abcm2ps and abc2midi are not completely compatible with each other, because the first program accepts a more extended syntax than the second. Moreover, it should be pointed out that some indications only make sense in a printed score. Consequently, when writing music in ABC bear in mind that:

- tremolo decorations don't produce audible effect;
- if a system change occurs in the middle of a piece, abc2midi gets lost and generates an incorrect MIDI file;
- in U: fields, abc2midi only accepts uppercase H... Z;
- ... there may be others.

Because of these small incompatibilities, we have the problem of writing music that can be converted by both abcm2ps and abc2midi. In theory, we should write two source files, one for abcm2ps and another for abc2midi: this is obviously unacceptable. An alternative is to use the abcpp preprocessor, which is explained in the next section.

uuuuuuu

Chapter 6

Converting

6.1 The abcpp Preprocessor

A preprocessor is a program that modifies a text file, according to commands contained in the file. abcpp is a preprocessor expressly designed for ABC files. It allows to

- exclude or include parts of a piece according to specified conditions;
- define *macros*, i.e. symbols and sequences of customised commands;
- rename commands, symbols, and notes;
- include parts of other files.

Needless to say, abopp is a command-line program. You run it specifying the names of input and output files, and possibly defining *symbols*.

6.1.1 Basic Usage

Let us look at an example. We will write a portable ABC file, which can be read correctly by abcm2ps and abc2midi. Save this source as test.abp:

```
X: 1
T: Test with abcpp
#ifdef ABCMIDI
T: (version for abc2midi)
Q: 1/4 = 120
#else
T: (version for abcm2ps)
Q: "Allegro" 1/4 = 120
#endif
K: C
cdef gabc'|c'bag fedc|
```

Note the lines that start in #: these are *directives* (commands) to the preprocessor.

The first directive means: "if the symbol ABCMIDI is defined, then..." If the condition is true, the source continues with the next two lines; otherwise, with the lines that follow the #else directive. The #endif directive terminates the condition.

To convert the source to make it acceptable to abc2midi, we'll run abcpp with this command line:

```
abcpp -ABCMIDI test.abp test-midi.abc
```

This way we define the ABCMIDI symbol, and a new ABC file will be created:

```
X: 1
T: Test with abcpp
T: (version for abc2midi)
Q: 1/4 = 120
K: C
cdef gabc'|c'bag fedc|
```

If we run abopp without defining any symbols, we'll get the right source for abcm2ps:

```
abcpp test.abp test-ps.abc

X: 1
T: Test with abcpp
T: (version for abcm2ps)
Q: "Allegro" 1/4 = 120
K: C
cdef gabc'|c'bag fedc|
```

Let us consider another example. Some ABC applications don't support invisible rests. To make it possible to use them portably, we have to insert these lines in the source:

```
#ifdef OLD
#define !x! z
#else
#define !x! x
#endif
```

In plain English: "if the OLD symbol is defined, then turn the !x! decoration into z; otherwise, !x! will become x". As you write the tune, you will use !x! to denote invisible rests. When you convert the source for abcm2ps or other programs, the !x! symbol will be turned into x or z according to the presence of the symbol OLD.

6.1.2 Advanced Usage

We have seen in Figure 3.1 an example of ABC file in which the system changes. Unfortunately, abc2midi doesn't correctly handle this source, because the number of voices is variable.

Let us see how we can use abopp to obtain a version compatible with abc2midi. The idea is to write *all the voices*, even those that contain only rests, then provide specific instructions for abcm2ps and abc2midi. We will obtain a source where only voice 3 of parts A and C is printed, while the second will contain all voices.

```

6.2. ABC2ABC 95

6.2 abc2abc

T is part of the abcMIDI package. This command-line program is used to modify the ABC source in several ways. abc2abc is followed by the name of the file to modify, and then by one of these options:

- **-n** $\langle x \rangle$ reformats the source with $\langle x \rangle$ measures per line.
- **-t** $\langle n \rangle$ transposes the music by $\langle n \rangle$ semitones. $\langle n \rangle$ may be a negative number.
- **-d** doubles the note lengths.
- **-v** halves the note lengths.
- $-\mathbf{v} \langle \mathbf{x} \rangle$ outputs only voice $\langle \mathbf{x} \rangle$ of a polyphonic file.¹
- **-X** $\langle n \rangle$ for a file with several pieces, renumbers the X: field starting with $\langle n \rangle$.

As usual, here is an example. Let us modify this scale:

```
X: 1
L: 1/4
K: C
CDEF|GABc|cdef|gabc'|c'cCz|
```

starting abc2abc with this command line:

```
$ abc2abc cde.abc -n 2 -t 2
```

that is, we are reformatting the source to get two measures per line and transposing by two semitones up. This is what we obtain:

```
X:1
L:1/4
K:Eb
%
EFGA|Bcde|
efga|bc'd'e'|
e'eEz|
```

The transposing feature will be extremely useful to players of clarinet and other transposing instruments.

uuuuuuu

¹The program abc2prt (Section 7.4) works better.

Chapter 7

Other Possibilities

7.1 Inserting Music in Other Programs

Sheet music in PostScript format can be easily converted to other formats suitable for word processing, web pages, etc. In practice, there are only two recommended formats: JPG and PNG. The latter is the best.

To convert PostScript to PNG, Windows users can simply use GSview. Select File/Convert, choose png16 in the Device field, then select the pages you wish to convert.

Resolution is a very important parameter. The higher the resolution, the better the quality of the output; but the file size also grows exponentially. A resolution of 300 dots per inch is fine.

Unix users could use the low-level Ghostscript interpreter. The following script converts an input file to PNG:

```
#!/bin/sh
FILE=$(basename $1 .ps)
gs -dNOPAUSE -q -dBATCH -sPAPERSIZE=a4 \
-sDEVICE=pnggray \
-dTextAlphaBits=4 -dGraphicsAlphaBits=4 \
-r300x300 \
-sOutputFile=$FILE-%003d.png \
$1
```

A similar method is using convert, a command provided by the ImageMagick package (http://www.imagemagick.org/). You use it as in this example:

```
convert -density 300x300 file.ps file.png
```

The -density parameter specifies the resolution.

7.2 Inserting Music in LATEX

This guide is written in LATEX, which you may want to use instead of a word processor. To insert ABC music in LATEX documents, you have to decide whether your final format will be PostScript or PDF.

In both cases, you will have to convert the score to EPS (encapsulated PostScript). This is done either by specifying the -E switch in the abcm2ps command line, or using the command ps2epsi. This one is part of Ghostscript. When you are done, you will include the graphicx package in your document and include the music as in this example:

```
\documentclass[a4paper,12pt]{article}
\usepackage{graphicx}
\begin{document}
This is some ABC music:

\medskip
\includegraphics[width=\linewidth]{music.eps}
\end{document}
```

If you wish to use pdflatex, you will have to convert the score from EPS to PDF using epstopdf, then insert the PDF file in the LATEX source.

7.2.1 Using abc. sty

Prof. Enrico Gregorio of University of Verona, Italy, has written a package that enables the inclusion of ABC code in LATEX documents. The relevant archive, called abc.zip, can be freely obtained from CTAN mirrors. Please see Section A.1 for details.

Once installed, the file abc. sty provides the following facilities:

- the abc environment
- the \abcinput command
- the \abcwidth parameter.

More explanations are included in the package documentation. This is a sample LATEX document that employs abc.sty:

```
\documentclass[a4paper,12pt]{article}
\usepackage[generate,ps2eps]{abc}
\usepackage{mathptmx}
\begin{document}
\title{Example of ABC in \LaTeX{}}
\author{Guido Gonzato}
\date{}
\maketitle

This is a short piece.
\medskip
```

```
\begin{abc}
X:4
T:Cronin's Hornpipe
R:hornpipe
S: Keenan and Glackin
E:7
M:C|
L:1/8
K:G
BA|GABc dBde|gage dega|bage dBGB|cABG A2BA|
GABc dBde|gage dega|bage dBAB|G2G2 G2:|
fg|afd^c d2ga|bged e2ga|(3bag (3agf gedB|(3cBA AG AcBA|
GABc dBde|~g3e dega|bage dBAB|G2G2 G2:|
\end{abc}
\medskip
Let's now include a tune we have in the current directory as
\file{tune.abc}:
\medskip
\abcinput{tune}
\end{document}
```

7.3 Converting Graphics to EPS

Very often, graphic files are in JPG, GIF or PNG format. Converting such files into EPS files suitable for inclusion with the %%EPS command is best done with yet another command-line program, bmeps. It is available from http://www.ctan.org/tex-archive/support/bmeps; I suggest that Windows users download the provided static binary.

bmeps is used as in this example:

```
$ bmeps -c myfile.png myfile.eps
```

If you omit -c, the resulting EPS file will be in black and white.

7.4 Parts Extraction

Another useful tool is abc2prt, which extract voices from polyphonic sources. You use abc2prt to create new ABC files containing the single voices.

For example, let us suppose we want to extract the tenor part (voice 3) from the Ave Verum listed in Section 4.1. All you have to do is run abc2prt this way:

abc2prt -3 aveverum.abc aveverum-3.abc

A new ABC file called aveverum-3.abc, containing only voice 3, will be created. Needless to say, abc2prt is integrated in JEDABC.

7.5 Final Comments

I started with ABC several years ago, and it's always been my tool of choice whenever I needed to make a score. This manual started out as a list of notes I wrote for myself, and it slowly grew to its present form. Since the ABC software is free, I decided it was only fair to release this manual for free as well.

A big "thank you!" to the author of abcm2ps, Jean-François Moine, for writing such a beautiful and useful program; to Michael Methfessel for writing the original abc2ps; to James Allwright for writing the original abcMIDI, and to Seymour Schlien for maintaining and improving it; to Chris Walshaw for creating ABC; to Norman Schmidt who helped me translating parts of this manual into English.

Thanks to my friend Sandro Pasqualetto and to Gianni Cunich for their suggestions on how to improve this guide. Last but not least, thanks to all people who contribute to ABC!

7.5.1 Please, Make a Donation...

I say again, this manual is free. That said, if the results of my work on ABC are useful to you, it would be a good thing if you made a donation. I used to ask for a little amount of money, which I don't need anymore now that the mortgage's over. So: please make a donation to a charity of your choice, and let me know. You will gain some good karma.

May I ask that you send me a postcard, too? I'm especially fond of natural landscapes. Mountain views or geology images will make my day.

This is my home address: Guido Gonzato, Via Monte Ortigara 2/a, 37126 Verona, Italy. Thank you so much!

7.5.2 In Loving Memory of Annarosa Del Piero, 1930–2000

I had the privilege to be a friend of Annarosa's, without whom I would be a different person.

No rhetoric, Annarosa was unique. She profoundly loved and enjoyed art and music. She shared her love with me when I was just a kid, giving me records of opera arias as presents. She took me by train to visit Venice for the first time in my life, and she introduced me to the beauty of the mountains.

She confronted her fatal illness with courage and dignity. Till the end she listened to her favourite music, till the end she gave me beautiful records of operas as present. This guide is dedicated to her memory: a tiny leaf born from the seed she throwed when she had a six-year-old kid listen to Rigoletto, so many years ago. Ciao, Annarosa.

Appendix A

Bits & Pieces

A.1 Web Links

The ABC 2 home page:

http://abcplus.sourceforge.net

The original ABC page:

http://www.abcnotation.com

The ABC Project page:

http://abc.sourceforge.net/

The abcm2ps home page:

http://moinejf.free.fr

The abc2midi home page and user guide:

http://ifdo.pugmarks.com/~seymour/runabc/top.html

http://ifdo.pugmarks.com/~seymour/runabc/abcguide/abc2midi_guide.html

Hudson Lacerda's ABC page, including advanced customisation and PostScript new routines:

http://hudsonlacerda.webs.com/

The Mandolintab web-based ABC converter:

http://mandolintab.net/abcconverter.php

Abctab2ps is an almost complete implementation of ABC 2 that supports tablatures for lute:

http://www.lautengesellschaft.de/cdmm/

The Philip's Music Writer home page is about a powerful and easy-to-use textual music notation format, which could be a valuable alternative to ABC:

http://www.quercite.com/pmw.html

Lilypond is another high-quality music notation format, very powerful but rather complex:

http://lilypond.org/web/

The abc package for LATEX:

http://www.ctan.org/tex-archive/macros/latex/contrib/abc/

Finally, the MusiXT_EX home page. This is a T_EX-based, very complex notation that spurred the creation of two spinoffs, PMX and M-Tx:

http://icking-music-archive.org/

A.3 Glossary

editor: a program to write "ASCII text", that is with no special format. Windows' Notepad (ugh), emacs and vim are some well-known editors.

font: type of character; for instance, Times or Helvetica.

GPL: a software license that disciplines the use of many programs available from the Internet. Briefly, a GPL'ed program can be freely used, modified and shared, without having to pay for it. Please visit http://www.gnu.org/ for more details.

MIDI: roughly speaking, the audible equivalent of sheet music. You can listen to a MIDI file using dedicated players.

PDF: file format invented by Adobe, very common on the Internet to distribute documentation. It is a spinoff of PostScript.

PostScript: file format invented by Adobe. Unlike graphic files like JPG, PNG or others, Post-Script is a *vector* format. This means that one can magnify the image at will, without losing in details.

system: set of staves relative to the instruments that play together in a musical piece.

string: word, set of characters.

A.4 Character Sets

One of the nicest things in the world is diversity. Different languages use different characters, but this can lead to incompatibility problems when, say, an Italian musician wants to send his or her American friend an ABC source.

Fortunately, there exist a character set called ISO-8859-1 (Latin1) that includes accented characters used by many languages: all of central Europe, and all English-speaking countries. These characters have an ASCII code between 160 and 255, and can be typed as sequences when not available on the keyboard.

The Latin1 characters and the corresponding octal code are shown below. I *recommend* that you use the $\xspace \xspace \xspace \xspace$ sequence even if you do have these characters on your keyboard, because this makes the source more portable.

ISO 8859-1 (Latin1)

\240	; \241	¢ \242	£ \243	¤ \244	¥ \245	\246	§ \247
"\250	© \251	a \252	«\253	¬ \254	\255	® \256	- \257
°\260	± \261	² \262	³ \263	´\264	μ \265	¶ \266	· \267
, \270	¹ \271	° \272	» \273	½ \274	½ \275	³ ⁄ ₄ \276	¿ \277
À\300	Á \301	Â\302	à \303	Ä \304	Å \305	Æ \306	Ç \307
È\310	É \311	Ê\312	Ë \313	Ì \314	Í \315	Î\316	Ï \317
Ð \320	Ñ \321	Ò \322	Ó ∖323	Ô \324	Õ \325	Ö \326	× \327
Ø \330	Ù \331	Ú \332	Û \333	Ü \334	Ý \335	₽ \336	ß \337
à \340	á \341	â \342	ã \343	ä \344	å \345	æ \346	ç \347
è\350	é \351	ê \352	ë \353	ì\354	í \355	î \356	ï \357
ð \360	ñ \361	ò\362	ó \363	ô \364	õ \365	ö \366	÷ \367
ø \370	ù \371	ú \372	û \373	ü \374	ý \375	þ \376	ÿ\377

A.5 Formatting Commands

Command parameters will be specified as follows:

Parameter	Туре
length	unit length indicated in cm, in or pt
text	generic text
char	character
logical	logical value, yes or no, or 1 or 0
int	integer number
float	number with decimals
str	character string

A.5.1 Page Format

These commands set the page geometry.

- **%*Botmargin** $\langle length \rangle$: sets the page bottom margin to $\langle length \rangle$.
- **%%footer** $\langle text \rangle$: sets the text to be printed as footer on each page; see Section 4.1.8 for details.
- **%%header** (*text*): sets the text to be printed as header on each page; see Section 4.1.8 for details.
- **%%indent** $\langle length \rangle$: sets the indentation for the first line or system to $\langle length \rangle$.
- **%%landscape** $\langle logical \rangle$: if 1, sets the page layout as landscape.
- **%%leftmargin** $\langle length \rangle$: sets the page left margin to $\langle length \rangle$.
- **%%multicol** (*command*): defines columns. (*command*) may be start, new, and end. See Section 4.1.6 for details.
- %%pageheight (*length*): sets the page height to (*length*). For European A4 paper, the right value is 29.7cm; for US Letter, 11in.
- **%*pagewidth** $\langle length \rangle$: sets the page width to $\langle length \rangle$. For European A4 paper, the right value is 21cm; for US Letter, 8.5in.
- **%%rightmargin** $\langle length \rangle$: sets the page right margin to $\langle length \rangle$.
- **%%staffwidth** $\langle length \rangle$: used as an alternative to the commands %%pageheight and %%pagewidth.
- **%%topmargin** $\langle length \rangle$: sets the page top margin to $\langle length \rangle$.

A.5.2 Text

These commands are used to write text lines within a tune and between tunes. Fonts and spacing are set with other commands that we will examine later on.

%%begintext...%%endtext: the pair %%begintext and %%endtext includes a group of text lines. These lines will be printed. If no text follows %%, the line is a paragraph separator. For example:

```
%%begintext
%%Spanish folk song, usually
%%accompanied by guitar and cymbals.
%%endtext
```

%%text $\langle text \rangle$: writes the following text. For example:

The command %%begintext can be given a parameter to change the text alignment:

```
%%begintext obeylines prints text as is;
%%begintext fill (or ragged) formats the text to the page margins;
%%begintext justify (or align) as above, but aligns to the page right margin;
%%begintext skip ignores the following lines.
%%center \( \text \): centers the following text.
```

```
%%text Spanish folk song
```

%%textoption (*int*): sets the default text option to be used between %%begintext and %%endtext, or in %%EPS files. The parameter can be a digit or a corresponding string: 0 or obeylines), 1 (justify), 2 (fill), 3 (center), 4 (skip), 5 (right). If the option is 4 (skip), no text or EPS is output.

A.5.3 Fonts

These commands specify the character fonts used in various parts of a score. Please note that the common True Type fonts used by Windows *are not the same fonts* used by abcm2ps. In fact, abcm2ps uses the PostScript fonts, provided for and managed by Ghostscript.

Standard fonts are shown in Appendix A.7. I remind you that indications for adding new fonts are given in Section 4.5.4.

```
%%annotationfont \( \string \): font of annotations.
%%composerfont \( \string \): C: field font.
%%footerfont \( \string \): font of %%footer lines.
%%font \( \string \): declares a font for later usage.
%%gchordfont \( \string \): guitar chords font.
%%headerfont \( \string \): font of %%header lines.
```

```
%%historyfont (string): font of H: field.
%%infofont \langle string \rangle: text font in I: fields.
%%measurefont (string) [box]: text font of measure numbers. If the word box is present,
      a box is drawn around the measure number.
%%partsfont (string): P: fields font.
%%repeatfont \langle string \rangle: font of repeat numbers or text.
%*setfont-\langle int \rangle \langle string \rangle \langle int \rangle: sets an alternate font for strings. In most strings, the cur-
      rent font may be changed by n (n = 1, 2, 3, 4). 0 resets the font to the default value.
%%subtitlefont \langle string \rangle: font of the second T: field.
%%tempofont (string): tempo font.
%%textfont \langle string \rangle: text font in %%text lines.
%%titlecaps (logical): if true, writes the title in capital letters.
%%titlefont \langle string \rangle: font of the first T: field.
%%titleformat (string): defines the format of the tune title. This format overrides %%ti-
      tleleft, %%infoline, and %%composerspace. See Section 4.1.7 for examples.
%%titleleft (logical): if true, writes the title left-aligned instead of centered.
%%voicefont (string): font of voice names.
%%vocalfont \langle string \rangle: font of the text in w: lines.
%%wordsfont \langle string \rangle: font of the text in W: lines.
```

A.5.4 Spacing

These commands specify spacing between score elements.

```
%*barsperstaff \langle int \rangle: attempts to typeset the score with \langle int \rangle bars on each line.
```

- **%%breaklimit** (*float*): used together with %%maxshrink, it lets the user control where line breaks may occur. The parameter can range between 0.5 (line break occurs when the line is 50% full) and 1.0.
- **%%breakoneoln** $\langle logical \rangle$: if true, treats an end of line as if it were a space (i.e. breaks note beams).
- **%%composerspace** $\langle length \rangle$: sets the vertical space before the composer to $\langle length \rangle$.
- **%%gracespace** $\langle float \rangle \langle float \rangle$: defines the space before, within and after grace notes.

- **%%infospace** $\langle length \rangle$: sets the vertical space before the infoline to $\langle length \rangle$.
- **%%linebreak** (*string*): defines the line break separators. The string may be empty or contain the values <EOL>, \$, !, and <none>. The latter option (or an empty string) computes line breaks automatically, as the deprecated command %%continueall.
- **%%lineskipfac** $\langle float \rangle$: sets the factor for spacing between lines of text to $\langle float \rangle$.
- **%*maxshrink** $\langle float \rangle$: sets how much to compress horizontally when staff breaks are chosen automatically. $\langle float \rangle$ must be between 0 (don't shrink) and 1 (full shrink).
- **%%maxstaffsep** (*length*): sets the maximum vertical space between staves.
- **%*maxsysstaffsep** $\langle length \rangle$: sets the maximum vertical space between systems.
- **%%musicspace** $\langle length \rangle$: sets the vertical space before the first staff to $\langle length \rangle$.
- %newpage: sets a page break.
- **%*notespacingfactor** $\langle float \rangle$: sets the proportional spacing of notes. The default value is 1.414 ($\sqrt{2}$); 1 makes all notes equally spaced.
- **%*parskipfac** $\langle float \rangle$: sets the factor for spacing between parts to $\langle float \rangle$.
- **%*partsspace** $\langle length \rangle$: sets the vertical space before a new part to $\langle length \rangle$.
- **%%scale** $\langle float \rangle$: sets the music scale factor to $\langle float \rangle$.
- **%%sep:** prints a centered separator (a short line).
- **%%sep** $\langle length1 \rangle \langle length2 \rangle \langle length3 \rangle$: prints a separator of length $\langle length3 \rangle$, with spacing $\langle length1 \rangle$ above and $\langle length2 \rangle$ below.
- **%%slurheight** (*float*): sets the slur height factor; lesser than 1 flattens the slur, greater than 1 expands it.
- **%%staffbreak** $\langle length \rangle$ ["f"]: sets a $\langle length \rangle$ -long break (gap) in the current staff. If the letter "f" is present, the staff break is forced even if it occurs at the beginning or end of a line.
- **%%staffsep** $\langle length \rangle$: sets the vertical space between different systems to $\langle length \rangle$.
- **%%stretchlast** $\langle logical \rangle$: stretches the last staff of the tune when underfull.
- **%stretchstaff** $\langle logical \rangle$: stretches underfull staves across page.
- **%%subtitlespace** $\langle length \rangle$: sets the vertical space before the subtitle to $\langle length \rangle$.
- **%%sysstaffsep** $\langle length \rangle$: sets the vertical space between staves in the same system to $\langle length \rangle$.
- **%*textspace** $\langle length \rangle$: sets the vertical space before texts to $\langle length \rangle$.
- **%%titlespace** $\langle length \rangle$: sets the vertical space before the title to $\langle length \rangle$.

- **%%topspace** $\langle length \rangle$: sets the vertical space at the top of a tune to $\langle length \rangle$. Note that a tune may begin with %%text commands before the title.
- **%%vocalspace** $\langle length \rangle$: sets the vertical space before the lyrics under staves to $\langle length \rangle$.
- **%%voicescale** (*length*): sets the scale of a voice, or of all voices if present in the header.
- **%%vskip** $\langle h \rangle$: adds $\langle h \rangle$ vertical space. $\langle h \rangle$ may be a negative value.
- **%%wordsspace** $\langle length \rangle$: sets the vertical space before the lyrics at end of the tune to $\langle length \rangle$.

A.5.5 Other Commands

Miscellaneous commands are grouped in this section.

- **%%abc2pscompat** $\langle logical \rangle$: if true, reverts to the old metod of dealing with notes in bass and other clefs. Please see Section 2.2.1.
- \$abcm2ps $\langle char \rangle$: changes the character that defines a pseudo-comment.
- **%%alignbars** $\langle int \rangle$: aligns the bars of the next $\langle int \rangle$ lines of music. It only works on single-voice tunes.
- **%%aligncomposer** $\langle int \rangle$: specifies where to print the composer field. A negative value means "on the left", 0 means "centre", and a positive value means "on the right".
- **%%autoclef** (*logical*): if true, prints clefs and possibly clef changes when no clef is defined in K: or V:.
- **%%beginps-%%endps:** starts/ends a sequence of PostScript commands; please see Section 4.5.1.
- **%%beginsvg-%%endsvg:** starts/ends a sequence of SVG commands; please see Section 4.5.1.
- **%%bstemdown** (*logical*): if true, the stem of the note on the middle of the staff goes downwards. Otherwise, it goes upwards or downwards according to the previous note.
- **%%cancelkey** (*logical*): if true, accidentals are cancelled using natural signs when the key signature changes.
- %%clef \(\clime \) [line] [octave]: inserts a clef change, in a manner similar to K:. \(\clime \) [clef \(\) may be treble (or G2), alto (C3), tenor (Cf), bass (F4), perc (P2), G, C, G, C, F, P, or none. The latter prints no clef on the staff. The name of a user-provided PostScript glyph may also be used. [line] specifies the staff line on which the clef sits. [octave] can be +8 or -8, to print '8' above or below the clef; \(^8 \) or _8, to print '8' above or below the clef and perform octave transposition.
- **%%combinevoices** (*logical*): if true, notes of same duration that belong to voices of the same staff are combined producing chords. It does not apply when note pitches are in unison, inverted or differ by a second.

- **%%contbarnb** $\langle logical \rangle$: if true, the bar number of the second repeat(s) is reset to the number of the first repeat. If false, bars are sequentially numbered.
- **%%continueall** (*logical*): ignores the line breaks in tune if true. It's the equivalent of the -c command line flag. This command is deprecated; use %%linebreak none and %%linewarn 0 instead.
- **%%custos** (*logical*): if true, a custos is added at the end of each music line. A custos is a symbol that indicates the pitch for the first note of the next line. This command works with single voice tunes only.
- **%%dateformat** $\langle string \rangle$: defines the format of date and time. Default is %b %e, %Y %H: %M. The fields specify, respectively: abbreviated month name (Jan–Dec), day of month (1–31), year, hour (0–23), minute (0–59).
- **%%deco** $\langle string1 \rangle \langle int1 \rangle \langle string2 \rangle \langle int2 \rangle \langle int3 \rangle \langle int4 \rangle \langle string3 \rangle$: adds a new decoration. Details are explained in Section 4.5.
- **%%decoration** $\langle char \rangle$: defines the decoration separator, which can be ! (default) or +.
- **%%dblrepbar** (*string*): defines how double repeat bars are drawn; e.g. :] [: (default), or ::, or:|:.
- **%%dynalign** (*logical*): if true, horizontally aligns the dynamics marks.
- **%*dynamic** (*int*): sets the position of dynamics (e.g. crescendo, etc.). The parameter may be '0' (or "auto") for automatic position; '1' or "above", '2' or "below", '3' or "hidden" to hide dynamics marks.
- **%%EPS** (*string3*): includes an external EPS file in the score.
- **%%flatbeams** (logical): if true, forces flat beams in bagpipe tunes (K: HP).
- **%%format** (*string*): reads the format file specified as parameter.
- **%%gchordbox** (*logical*): draws a box around accompaniment chords.
- **%%glyph** $\langle string1 \rangle$ $\langle string1 \rangle$: sets the name of a Unicode glyph. The first parameter is a hexadecimal value, the second is the name of the associated glyph in the font files.
- **%%gstemdir** (*int*): sets the position of grace notes stems. The parameter may be '0' (or "auto") for automatic position; '1' or "above", '2' or "below", '3' or "hidden" to hide dynamics marks.
- **%%graceslurs** (*logical*): draws slurs on grace notes.
- **%%hyphencont** $\langle logical \rangle$: if true and if lyrics under the staff end with a hyphen, puts a hyphen in the next line.
- **%%infoline** $\langle logical \rangle$: if true, displays the rhythm and the origin on the same line, plus the A: field.

- **%%infoname** $\langle string \rangle \langle string \rangle$: defines the fields to be printed when %%writehistory is true.
- **%%keywarn** (*logical*): if true, a cautionary key signature is printed when a key signature change occurs at the beginning of a music line.
- **%%linewarn** (*logical*): if true, outputs a warning message if there are too many or too few elements in a music line.
- **%*measurenb** $\langle int \rangle$: draws the measure number every $\langle int \rangle$ bars.
- **%*measurebox** (*logical*): if true, draws a box around measure numbers.
- **%*measurefirst** $\langle int \rangle$: starts numbering the measures from $\langle int \rangle$. This command is obsolete and should be replaced by **%***setbarnb.
- **%%micronewps** (*logical*): if true, uses the new PostScript function to draw microtonal accidentals.
- **%%musiconly** $\langle logical \rangle$: if true, lyrics are not output.
- **%%oneperpage** $\langle logical \rangle$: outputs one tune per page.
- **%%ornament** (*int*): sets the position of ornaments (e.g. trill, etc.). The parameter may be '0' (or "auto") for automatic position; '1' or "above", '2' or "below", '3' or "hidden" to hide ornaments.
- %%pango (logical): if abcm2ps was compiled with Pango support, this command enables or disables PostScript output with Pango.
- **%%partsbox** (*logical*): draws a box around part names.
- **%%pdfmark** (*int*): if the parameter is 1, inserts marks in the PostScript output for titles. Post-Script to PDF translators can use the marks to create a PDF tune index. If the parameter is greater than 1, marks are inserted for titles and subtitles.
- **%*postscript** $\langle string \rangle$: a series of these commands lets the user add a new PostScript routine, or change an existing one.
- **%%ps** (*string*): same as %%postscript.
- **%%repbra** (*logical*): if false, prevents displaying repeat brackets for the current voice.
- **%%repeat** $\langle int1 \rangle \langle int2 \rangle$: repeats a sequence of notes or bars.
- **%%score** $\langle string \rangle$: defines how staves are to be printed. Please see Section 3.1.2 for details.
- **%%setbarnb** (*int*): sets the number of the next measure, excluding the first. To set the number of the first measure, the command must be written in the tune header.
- **%%setdef1** (*logical*): if true, outputs some indications about the note/chord and/or decorations for customization purposes. These indications are stored in the PostScript variable "defl".

- **%%shiftunison** (*logical*): if true, shifts note heads that belong to different voices that are in unison. It applies to dotted notes and notes shorter than minim.
- **%*splittune** $\langle logical \rangle$: if true, splits tunes that do not fit in a single page.
- **%%squarebreve** (*logical*): displays "brevis" notes in square format.
- **%%straightflags** (*logical*): prints straight flags on stems in bagpipe tunes.
- **%%staff** $\langle int \rangle$: prints the next symbols of the current voice on the $\langle int \rangle$ -th staff.
- **%%stafflines** (*int*): sets the number of staff lines of the current voice; default is 5.
- **%%staffnonote** (*int*): avoids printing a staff according to the parameter. If it's 0, the staff is not printed if it contains only invisible rests and notes; if it's 1, the staff is not printed if it contains only rests and invisible notes; if it's 2, the staff is printed.
- **%%staffscale** $\langle float \rangle$: sets the scale of the staff of the current voice.
- **%%staves** (*string*): defines how staves are to be printed. This command is deprecated; please use score instead. Please see Section 3.1.2 for details.
- **%%stemdir** (*int*): sets the note stems directions. The parameter may be '0' (or "auto") for automatic position; '1' or "up", '2' or "down".
- **%%stemheight** $\langle float \rangle$: sets the stem height to $\langle float \rangle$.
- **%%tablature:** defines a tablature. Please see Section sec:tablatures.
- **%%timewarn** (*logical*): if true, if a time signature occurs at the beginning of a music line, a cautionary time signature is added at the end of the previous line.
- **%%titletrim** (*logical*): if true, move the last word of a title to the head if it starts with a capital letter and it's preceded by a space and a comma.
- **%%transpose** $\langle int \rangle$ [char]: transposes the music by $\langle int \rangle$ semitones. The optional parameter may be # or b, meaning that the new key signature will have sharps or flats.
- **%%tuplets** $\langle int1 \rangle \langle int2 \rangle \langle int3 \rangle$: defines how tuplets are to be drawn. See Section 4.5.5 for details.
- **%%user** $\langle string \rangle$: this command is the equivalent of the U: field, and can be used to redefine default decorations in format files.
- **%%vocal** (*int*): sets the position of lyrics. The parameter may be '0' (or "auto") for automatic position; '1' or "above", '2' or "below", '3' or "hidden" to hide lyrics.
- **%%vocalabove** (*logical*): draws the vocals above the staff. This command is obsolete and should be replaced by %%vocal.
- **%%volume** (*int*): sets the position of volume decorations (!f!, etc.). The parameter may be '0' (or "auto") for automatic position; '1' or "above", '2' or "below", '3' or "hidden" to hide the decorations.
- **%%writefields** $\langle string \rangle \langle logical \rangle$: if true, displays the information fields defined in $\langle string \rangle$.

A.6 abcMIDI commands

Some of these commands will only make sense to advanced users who have some experience with MIDI files. In a few cases, explanations are taken from the abcquide.txt file included in the abcMIDI archive.

- %%MIDI barlines: turns off %%nobarlines.
- **%%MIDI** bassprog $\langle int \rangle$: sets the MIDI instrument for the bass notes in accompaniment chords to $\langle int \rangle$ (0–127).
- **%%MIDI** bassvol $\langle int \rangle$: sets the velocity (i.e., volume) of the bass notes to $\langle int \rangle$ (0–127).
- **%%MIDI** beat $\langle int1 \rangle \langle int2 \rangle \langle int3 \rangle \langle int4 \rangle$: controls the volumes of the notes in a measure. The first note in a bar has volume $\langle int1 \rangle$; other "strong" notes have volume $\langle int2 \rangle$ and all the rest have volume $\langle int3 \rangle$. These values must be in the range 0–127. The parameter $\langle int4 \rangle$ determines which notes are "strong". If the time signature is x/y, then each note is given a position number k = 0, 1, 2... x-1 within each bar. If k is a multiple of $\langle int4 \rangle$, then the note is "strong".
- **%%MIDI** beataccents: reverts to normally emphasised notes. See also <code>%%MIDI</code> nobeataccents.
- **%%MIDI** beatmod (*int*): increments the velocities as defined by %%MIDI beat
- **%%MIDI** beatstring (string): similar to %%MIDI beat, but indicated with an fmp string.
- **%%MIDI** $\mathbf{c} \langle int \rangle$: specifies the MIDI pitch which corresponds to \mathbb{C} . The default is 60. This number should normally be a multiple of 12.
- **%%MIDI** channel $\langle int \rangle$: selects the melody channel $\langle int \rangle$ (1–16).
- **%%MIDI** chordattack $\langle int \rangle$: delays the start of chord notes by $\langle int \rangle$ MIDI units.
- **%%MIDI** chordname (*string int1 int2 int3 int4 int5 int6*): defines new chords or redefines existing ones as was seen in Section 5.1.10.
- **%%MIDI** chordprog $\langle int \rangle$: sets the MIDI instrument for accompaniment chords to $\langle int \rangle$ (0–127).
- **%%MIDI** chordvol $\langle int \rangle$: sets the volume (velocity) of the chord notes to $\langle int \rangle$ (0–127).
- **%%MIDI** control $\langle bass/chord \rangle \langle int1 \ int2 \rangle$: generates a MIDI control event. If %%control is followed by $\langle bass \rangle$ or $\langle chord \rangle$, the event apply to the bass or chord channel, otherwise it will be applied to the melody channel. $\langle int1 \rangle$ is the MIDI control number (0–127) and $\langle int2 \rangle$ the value (0–127).
- **%%MIDI deltaloudness** $\langle int \rangle$: by default, !crescendo! and !dimuendo! modify the beat variables $\langle vol1 \rangle$ $\langle vol2 \rangle$ $\langle vol3 \rangle$ 15 volume units. This command allows the user to change this default.

- **%%MIDI** drone $\langle int1 int2 int3 int4 int5 \rangle$: specifies a two-note drone accompaniment. $\langle int1 \rangle$ is the drone MIDI instrument, $\langle int2 \rangle$ the MIDI pitch 1, $\langle int3 \rangle$ the MIDI pitch 2, $\langle int4 \rangle$ the MIDI volume 1, $\langle int5 \rangle$ the MIDI volume 2. Default values are 70 45 33 80 80.
- **%%MIDI** droneoff: turns the drone accompaniment off.
- **%%MIDI** droneon: turns the drone accompaniment on.
- **%%MIDI drumbars** $\langle int \rangle$: specifies the number of bars over which a drum pattern string is spread. Default is 1.
- **%%MIDI** drum $\langle str \rangle$ $\langle int1 int2 int3 int4 int5 int6 int7 int8 \rangle$: generates a drum accompaniment pattern, as described in Section 5.1.12.
- **%%MIDI** drummap $\langle str \rangle$ $\langle int \rangle$: associates the note $\langle str \rangle$ (in ABC notation) to the a percussion instrument, as listed in Section A.8.2.
- **%%MIDI** drumoff turns drum accompaniment off.
- **%%MIDI** drumon turns drum accompaniment on.
- **%%MIDI fermatafixed:** expands a !fermata! by one unit length; that is, HC3 becomes C4.
- **%%MIDI fermataproportional:** doubles the length of a note preceded by !fermata!; that is, HC3 becomes C6. abc2midi does this by default.
- **%%MIDI gchordbars** $\langle str \rangle$: spreads the gchord string over $\langle n \rangle$ consecutive bars of equal length. The gchord string should be evenly divisible by $\langle n \rangle$ or else the gchords will not work properly.
- **%%MIDI** gchord $\langle str \rangle$: sets up how guitar chords are generated; please see Section 5.1.7.
- **%%MIDI** gchordoff: turns guitar chords off.
- **%%MIDI** gchordon: turns guitar chords on.
- **%%MIDI** grace $\langle float \rangle$: sets the fraction of the next note that grace notes will take up. $\langle float \rangle$ must be a fraction such as 1/6.
- **%%MIDI gracedivider** $\langle int \rangle$: sets the grace note length as $1/\langle int \rangle$ th of the following note.
- **%%MIDI makechordchannels** (*int*): this is a very complex command used in chords containing microtones. Please consult the abcMIDI documentation.
- **%%MIDI nobarlines:** normally, an accidental applied to a note also applies to other equal notes until the next bar. By using this command, the accidental will apply to the following note only.
- **%%MIDI** nobeataccents: forces the $\langle int2 \rangle$ volume (see %%MIDI beat) for each note in a bar, regardless of their position.

- **%%MIDI** noportamento: turns off the portamento controller on the current channel.
- %%MIDI pitchbend \(\langle bass/chord \rangle \) \(\langle int1 \) int2\\rangle: generates a pitchbend event on the current channel, or on the bass or chord channel as specified. The value given by the following two bytes indicates the pitch change. This option is not well documented.
- **%%MIDI** portamento [bass] [chord] $\langle int \rangle$: turns on the portamento controller (glide effect) on the current channel (or to bass/chord channel) and set it to $\langle int \rangle$. 0 turns off the effect.
- **%%MIDI** program [int1] $\langle int2 \rangle$: selects the program (instrument) $\langle int2 \rangle$ (0–127) for channel $\langle int1 \rangle$. If this is not specified, the instrument will apply to the current channel.
- **%%MIDI** randomchordattack: delays the start of chord notes by a random number of MIDI units.
- **%%MIDI ratio** (*int1 int2*): sets the ratio of note lengths in broken rhythm. Normally c>c will make the first note three times as long as the second; this ratio can be changed with %%ratio 2 1.
- **%%MIDI** rtranspose $\langle int1 \rangle$: transposes relatively to a prior %%transpose command by $\langle int1 \rangle$ semitones; the total transposition will be $\langle int1 + int2 \rangle$ semitones.
- **%%MIDI** snt $\langle int \rangle$ $\langle float \rangle$: alters the standard MIDI pitch of a note $\langle 0-127 \rangle$; e.g. %%MIDI snt 60 60.5 alters the pitch of C.
- **%%MIDI** temperament (int1) (int2): TO BE WRITTEN
- **%%MIDI temperamentlinear** $\langle float1 \ float2 \rangle$: changes the temperament of the scale. $\langle float1 \rangle$ specifies the size of an octave in cents of a semitone, or 1/1200 of an octave. $\langle float2 \rangle$ specifies in the size of a fifth (normally 700 cents).
- **%%MIDI** temperamentnormal: restores normal temperament.
- **%%MIDI transpose** $\langle int1 \rangle$: transposes the output by $\langle int1 \rangle$ semitones. $\langle int1 \rangle$ may be positive or negative.
- **%%MIDI trim** $\langle int1 \rangle$ $\langle int2 \rangle$: controls the articulation of notes and chords by placing silent gaps between the notes. The length of these gaps is determined by $\langle int1 \rangle / \langle int2 \rangle$ and the unit length is specified by the L: command. These gaps are produced by shortening the notes by the same amount. If the note is already shorter than the specified gap, then the gap is set to half the length of the note. It is recommended that $\langle int1 \rangle / \langle int2 \rangle$ be a fraction close to zero. Trimming is disabled inside slurs as indicated by parentheses. Trimming is disabled by setting $\langle int1 \rangle$ to 0.

A.7 PostScript Fonts

There are 35 standard PostScript fonts. They are all listed below, with the exception of ZapfDingbats which is not supported by abcm2ps.

A.8 MIDI Instruments

A.8.1 Standard instruments

The following is a complete list of the General MIDI standard instruments, subdivided according to instrument family. Remember, when using abc2midi the instrument number must be decreased by 1.

Piano	Chromatic Percussion	Organ
1. Acoustic Grand	9. Celesta	17. Drawbar Organ
2. Bright Acoustic	10. Glockenspiel	18. Percussive Organ
3. Electric Grand	11. Music Box	19. Rock Organ
4. Honky-Tonk	12. Vibraphone	20. Church Organ
5. Electric Piano 1	13. Marimba	21. Reed Organ
6. Electric Piano 2	14 . Xylophone	22. Accordion
7. Harpsichord	15. Tubular Bells	23. Harmonica
8. Clavinet	16. Dulcimer	24. Tango Accordion
Guitar	Bass	Solo Strings
25. Nylon String Guitar	33 . Acoustic Bass	41 . Violin
26. Steel String Guitar	34 . Electric Bass(finger)	42 . Viola
27. Electric Jazz Guitar	35. Electric Bass(pick)	43. Cello
28. Electric Clean Guitar	36 . Fretless Bass	44. Contrabass
29. Electric Muted Guitar	37. Slap Bass 1	45. Tremolo Strings
30 . Overdriven Guitar	38 . Slap Bass 2	46. Pizzicato Strings
31 . Distortion Guitar	39 . Synth Bass 1	47. Orchestral Strings
32 . Guitar Harmonics	40 . Synth Bass 2	48. Timpani
Ensemble	Brass	Reed
Ensemble 49. String Ensemble 1	Brass 57. Trumpet	Reed 65. Soprano Sax

49 . String Ensemble 1	57 . Trumpet	65. Soprano Sax
49. String Ensemble 150. String Ensemble 2	57. Trumpet 58. Trombone	65. Soprano Sax66. Alto Sax
49. String Ensemble 150. String Ensemble 251. SynthStrings 1	57. Trumpet58. Trombone59. Tuba	65. Soprano Sax66. Alto Sax67. Tenor Sax
49. String Ensemble 150. String Ensemble 251. SynthStrings 152. SynthStrings 2	57. Trumpet58. Trombone59. Tuba60. Muted Trumpet	65. Soprano Sax66. Alto Sax67. Tenor Sax68. Baritone Sax
49. String Ensemble 150. String Ensemble 251. SynthStrings 152. SynthStrings 253. Choir Aahs	57. Trumpet58. Trombone59. Tuba60. Muted Trumpet61. French Horn	65. Soprano Sax66. Alto Sax67. Tenor Sax68. Baritone Sax69. Oboe
